DARKWEB CRAWLER PROJECT

`darc` is designed as a swiss army knife for darkweb crawling. It integrates `requests` to collect HTTP request and response information, such as cookies, header fields, etc. It also bundles `selenium` to provide a fully rendered web page and screenshot of such view.

1.1 Main Processing

The `darc.process` module contains the main processing logic of the `darc` module.

`darc.process._process(worker)`

Wrapper function to start the worker process.

Parameters `worker` (`Union[darc.process.process_crawler, darc.process.process_loader]`) –

`darc.process._signal_handler(signum=None, frame=None)`

Signal handler.

If the current process is not the main process, the function shall do nothing.

Parameters

- `signum` (`Optional[Union[int, signal.Signals]]`) – The signal to handle.
- `frame` (`types.FrameType`) – The traceback frame from the signal.

See also:

- `darc.const.getpid()`

`darc.process.process(worker)`

Main process.

The function will register `_signal_handler()` for SIGTERM, and start the main process of the `darc` darkweb crawlers.

Parameters `worker` (`Literal[crawler, loader]`) – Worker process type.

Raises `ValueError` – If `worker` is not a valid value.

Before starting the workers, the function will start proxies through

- `darc.proxy.tor.tor_proxy()`
- `darc.proxy.i2p.i2p_proxy()`
- `darc.proxy.zeronet.zeronet_proxy()`

- `darc.proxy.freenet.freenet_proxy()`

The general process can be described as following for *workers* of `crawler` type:

1. `process_crawler()`: obtain URLs from the `requests` link database (c.f. `load_requests()`), and feed such URLs to `crawler()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` is `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `crawler()`: parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, `darc` will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`). Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, `darc` will check if allowed to crawl the URL.

Note: The root path (e.g. `/` in `https://www.example.com/`) will always be crawled ignoring `robots.txt`.

At this point, `darc` will call the customised hook function from `darc.sites` to crawl and get the final response object. `darc` will save the session cookies and header information, using `save_headers()`.

Note: If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped.

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If NOT, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for *workers* of `loader` type:

1. `process_loader()`: in the meanwhile, `darc` will obtain URLs from the selenium link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` is `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original Chrome object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

If in reboot mode, i.e. `REBOOT` is `True`, the function will exit after first round. If not, it will renew the Tor connections (if bootstrapped), c.f. `renew_tor_session()`, and start another round.

`darc.process.process_crawler()`

A worker to run the `crawler()` process.

`darc.process.process_loader()`

A worker to run the `loader()` process.

`darc.process._WORKER_POOL = None`

List of active child processes and/or threads.

Type `List[Union[multiprocessing.Process, threading.Thread]]`

1.2 Web Crawlers

The `darc.crawl` module provides two types of crawlers.

- `crawler()` – crawler powered by `requests`
- `loader()` – crawler powered by `selenium`

`darc.crawl.crawler(link)`

Single `requests` crawler for a entry link.

Parameters `link(darc.link.Link)` – URL to be crawled by `requests`.

The function will first parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, `darc` will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`).

Note: A host is new if `have_hostname()` returns `True`.

If `darc.proxy.null.fetch_sitemap()` and/or `darc.proxy.i2p.fetch_hosts()` failed when fetching such documents, the host will be removed from the hostname database through `drop_hostname()`, and considered as new when next encounter.

Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, `darc` will check if allowed to crawl the URL.

Note: The root path (e.g. / in <https://www.example.com/>) will always be crawled ignoring robots.txt.

At this point, `darc` will call the customised hook function from `darc.sites` to crawl and get the final response object. `darc` will save the session cookies and header information, using `save_headers()`.

Note: If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped, and the link will be removed from the `requests` database through `drop_requests()`.

If `LinkNoReturn` is raised, the link will be removed from the `requests` database through `drop_requests()`.

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If NOT, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

`darc.crawl.loader(link)`

Single selenium loader for a entry link.

Parameters

- **Link** – URL to be crawled by selenium.
- **link (darc.link.Link)** –

The function will first parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original `selenium.webdriver.Chrome` object.

Note: If `LinkNoReturn` is raised, the link will be removed from the selenium database through `drop_selenium()`.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

Note: When taking full-page screenshot, `loader()` will use `document.body.scrollHeight` to get the total height of web page. If the page height is **less than 1,000 pixels**, then `darc` will by default set the height as **1,000 pixels**.

Later `darc` will tell selenium to resize the window (in `headless` mode) to **1,024 pixels** in width and **110%** of the page height in height, and take a **PNG** screenshot.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

See also:

- `darc.const.SE_EMPTY`
- `darc.const.SE_WAIT`

1.3 URL Utilities

The `Link` class is the key data structure of the `darc` project, it contains all information required to identify a URL's proxy type, hostname, path prefix when saving, etc.

The `link` module also provides several wrapper function to the `urllib.parse` module.

`class darc.link.Link(url, proxy, url_parse, host, base, name)`
Bases: `object`

Parsed link.

Parameters

- `url` – original link
- `proxy` – proxy type
- `host` – URL's hostname
- `base` – base folder for saving files
- `name` – hashed link for saving files
- `url_parse` – parsed URL from `urllib.parse.urlparse()`

Returns Parsed link object.

Return type `Link`

Note: `Link` is a dataclass object. It is safely *hashable*, through `hash(url)`.

`__hash__()`
Provide hash support to the `Link` object.

`base: str`
base folder for saving files

`host: str`
URL's hostname

`name: str`
hashed link for saving files

`proxy: str`
proxy type

`url: str`
original link

`url_parse: urllib.parse.ParseResult`
parsed URL from `urllib.parse.urlparse()`

`darc.link.parse_link(link, host=None)`
Parse link.

Parameters

- **link** (*str*) – link to be parsed
- **host** (*Optional [str]*) – hostname of the link

Returns The parsed link object.

Return type *darc.link.Link*

Note: If host is provided, it will override the hostname of the original link.

The parsing process of proxy type is as follows:

0. If host is `None` and the parse result from `urllib.parse.urlparse()` has no netloc (or hostname) specified, then set hostname as `(null)`; else set it as is.
1. If the scheme is `data`, then the link is a data URI, set hostname as `data` and proxy as `data`.
2. If the scheme is `javascript`, then the link is some JavaScript codes, set proxy as `script`.
3. If the scheme is `bitcoin`, then the link is a Bitcoin address, set proxy as `bitcoin`.
4. If the scheme is `ed2k`, then the link is an ED2K magnet link, set proxy as `ed2k`.
5. If the scheme is `magnet`, then the link is a magnet link, set proxy as `magnet`.
6. If the scheme is `mailto`, then the link is an email address, set proxy as `mail`.
7. If the scheme is `irc`, then the link is an IRC link, set proxy as `irc`.
8. If the scheme is **NOT** any of `http` or `https`, then set proxy to the scheme.
9. If the host is `None`, set hostname to `(null)`, set proxy to `null`.
10. If the host is an onion (`.onion`) address, set proxy to `tor`.
11. If the host is an I2P (`.i2p`) address, or any of `localhost:7657` and `localhost:7658`, set proxy to `i2p`.
12. If the host is `localhost` on `ZERONET_PORT`, and the path is not `/`, i.e. **NOT** root path, set proxy to `zeronet`; and set the first part of its path as hostname.

Example:

For a ZeroNet address, e.g. `http://127.0.0.1:43110/1HeLLo4uzjaLetFx6NH3PMwFP3qbRbTf3D`, `parse_link()` will parse the hostname as `1HeLLo4uzjaLetFx6NH3PMwFP3qbRbTf3D`.

13. If the host is `localhost` on `FREENET_PORT`, and the path is not `/`, i.e. **NOT** root path, set proxy to `freenet`; and set the first part of its path as hostname.

Example:

For a Freenet address, e.g. `http://127.0.0.1:8888/USK@nwa8lHa271k2QvJ8aa0Ov7IHAV-DFOCFgmDt3X6BpCI,DuQSUZiI~agF8c-6tjsFFGuZ8eICrzWCILB60nT8KKo, AQACAAE/sone/77/`, `parse_link()` will parse the hostname as `USK@nwa8lHa271k2QvJ8aa0Ov7IHAV-DFOCFgmDt3X6BpCI, DuQSUZiI~agF8c-6tjsFFGuZ8eICrzWCILB60nT8KKo, AQACAAE`.

14. If none of the cases above satisfied, the proxy will be set as `null`, marking it a plain normal link.

The base for parsed link `Link` object is defined as

```
<root>/<proxy>/<scheme>/<hostname>/
```

where `root` is `PATH_DB`.

The name for parsed link `Link` object is the sha256 hash (c.f. `hashlib.sha256()`) of the original link.

`darc.link.quote(string, safe='/', encoding=None, errors=None)`
Wrapper function for `urllib.parse.quote()`.

Parameters

- `string` (`AnyStr`) – string to be quoted
- `safe` (`AnyStr`) – characters not to escape
- `encoding` (`Optional[str]`) – string encoding
- `errors` (`Optional[str]`) – encoding error handler

Returns The quoted string.

Return type `str`

Note: The function suppressed possible errors when calling `urllib.parse.quote()`. If any, it will return the original string.

`darc.link.unquote(string, encoding='utf-8', errors='replace')`
Wrapper function for `urllib.parse.unquote()`.

Parameters

- `string` (`AnyStr`) – string to be unquoted
- `encoding` (`str`) – string encoding
- `errors` (`str`) – encoding error handler

Returns The quoted string.

Return type `str`

Note: The function suppressed possible errors when calling `urllib.parse.unquote()`. If any, it will return the original string.

`darc.link.urljoin(base, url, allow_fragments=True)`
Wrapper function for `urllib.parse.urljoin()`.

Parameters

- `base` (`AnyStr`) – base URL
- `url` (`AnyStr`) – URL to be joined
- `allow_fragments` (`bool`) – if allow fragments

Returns The joined URL.

Return type `str`

Note: The function suppressed possible errors when calling `urllib.parse.urljoin()`. If any, it will return `base/url` directly.

`darc.link.urlparse(url, scheme='', allow_fragments=True)`
Wrapper function for `urllib.parse.urlparse()`.

Parameters

- `url (str)` – URL to be parsed
- `scheme (str)` – URL scheme
- `allow_fragments (bool)` – if allow fragments

Returns The parse result.

Return type `urllib.parse.ParseResult`

Note: The function suppressed possible errors when calling `urllib.parse.urlparse()`. If any, it will return `urllib.parse.ParseResult(scheme=scheme, netloc='', path=url, params='', query='', fragment='')` directly.

1.4 Source Parsing

The `darc.parse` module provides auxiliary functions to read `robots.txt`, sitemaps and HTML documents. It also contains utility functions to check if the proxy type, hostname and content type if in any of the black and white lists.

`darc.parse._check(temp_list)`

Check hostname and proxy type of links.

Parameters `temp_list (List[darc.link.Link])` – List of links to be checked.

Returns List of links matches the requirements.

Return type `List[darc.link.Link]`

Note: If `CHECK_NG` is `True`, the function will directly call `_check_ng()` instead.

See also:

- `darc.parse.match_host()`
- `darc.parse.match_proxy()`

`darc.parse._check_ng(temp_list)`

Check content type of links through HEAD requests.

Parameters `temp_list (List[darc.link.Link])` – List of links to be checked.

Returns List of links matches the requirements.

Return type `List[darc.link.Link]`

See also:

- `darc.parse.match_host()`
- `darc.parse.match_proxy()`
- `darc.parse.match_mime()`

`darc.parse.check_robots(link)`
Check if link is allowed in robots.txt.

Parameters `link` (`darc.link.Link`) – The link object to be checked.

Returns If link is allowed in robots.txt.

Return type `bool`

Note: The root path of a URL will always return `True`.

`darc.parse.extract_links(link, html, check=False)`
Extract links from HTML document.

Parameters

- `link` (`darc.link.Link`) – Original link of the HTML document.
- `html` (`Union[str, bytes]`) – Content of the HTML document.
- `check` (`bool`) – If perform checks on extracted links, default to `CHECK`.

Returns List of extracted links.

Return type `List[darc.link.Link]`

See also:

- `darc.parse._check()`
- `darc.parse._check_ng()`

`darc.parse.get_content_type(response)`
Get content type from response.

Parameters `response` (`requests.Response`) – Response object.

Returns The content type from response.

Return type `str`

Note: If the Content-Type header is not defined in `response`, the function will utilise `magic` to detect its content type.

`darc.parse.match_host(host)`
Check if hostname in black list.

Parameters `host` (`str`) – Hostname to be checked.

Returns If host in black list.

Return type `bool`

Note: If host is `None`, then it will always return `True`.

See also:

- `darc.const.LINK_WHITE_LIST`
- `darc.const.LINK_BLACK_LIST`

- `darc.const.LINK_FALLBACK`

`darc.parse.match_mime (mime)`

Check if content type in black list.

Parameters `mime (str)` – Content type to be checked.

Returns If mime in black list.

Return type `bool`

See also:

- `darc.const.MIME_WHITE_LIST`
- `darc.const.MIME_BLACK_LIST`
- `darc.const.MIME_FALLBACK`

`darc.parse.match_proxy (proxy)`

Check if proxy type in black list.

Parameters `proxy (str)` – Proxy type to be checked.

Returns If proxy in black list.

Return type `bool`

Note: If proxy is script, then it will always return `True`.

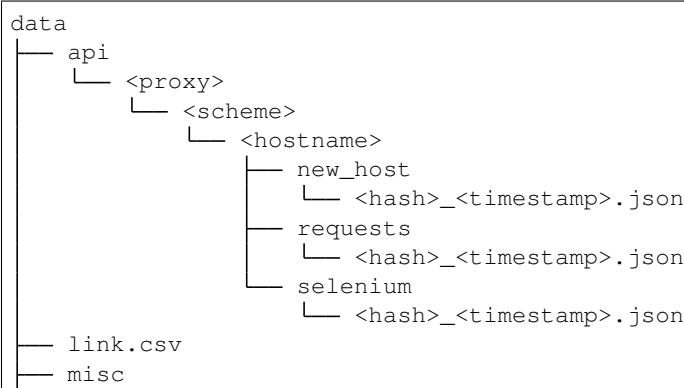

See also:

- `darc.const.PROXY_WHITE_LIST`
- `darc.const.PROXY_BLACK_LIST`
- `darc.const.PROXY_FALLBACK`

1.5 Source Saving

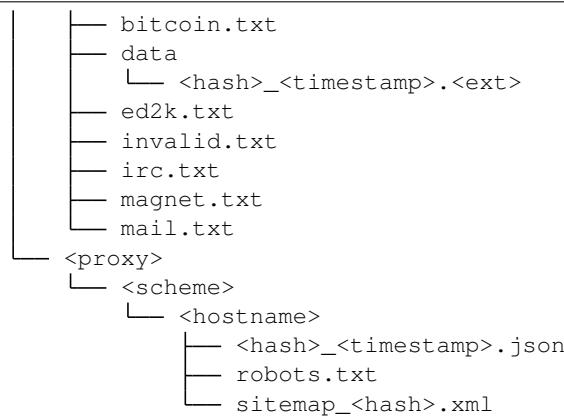

The `darc.save` module contains the core utilities for managing fetched files and documents.

The data storage under the root path (`PATH_DB`) is typically as following:

(continues on next page)

(continued from previous page)

`darc.save.sanitise(link, time=None, raw=False, data=False, headers=False, screenshot=False)`
Sanitise link to path.

Parameters

- `link (darc.link.Link)` – Link object to sanitise the path
- `time (datetime)` – Timestamp for the path.
- `raw (bool)` – If this is a raw HTML document from `requests`.
- `data (bool)` – If this is a generic content type document.
- `headers (bool)` – If this is response headers from `requests`.
- `screenshot (bool)` – If this is the screenshot from `selenium`.

Returns

- If `raw` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>_raw.html`.
- If `data` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.dat`.
- If `headers` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.json`.
- If `screenshot` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.png`.
- If none above, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.html`.

Return type str

See also:

- `darc.crawl.crawler()`
- `darc.crawl.loader()`

`darc.save.save_headers(time, link, response, session)`
Save HTTP response headers.

Parameters

- `time (datetime)` – Timestamp of response.

- **link** (`darc.link.Link`) – Link object of response.
- **response** (`requests.Response`) – Response object to be saved.
- **session** (`requests.Session`) – Session object of response.

Returns Saved path to response headers, i.e. `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestampl>.json`.

Return type `str`

The JSON data saved is as following:

```
{  
    "[metadata]": {  
        "url": "...",  
        "proxy": "...",  
        "host": "...",  
        "base": "...",  
        "name": "..."  
    },  
    "Timestamp": "...",  
    "URL": "...",  
    "Method": "GET",  
    "Status-Code": "...",  
    "Reason": "...",  
    "Cookies": {  
        "...": "..."  
    },  
    "Session": {  
        "...": "..."  
    },  
    "Request": {  
        "...": "..."  
    },  
    "Response": {  
        "...": "..."  
    },  
    "History": [  
        {"...": "..."}  
    ]  
}
```

See also:

- `darc.save.sanitise()`
- `darc.crawl.crawler()`

`darc.save.save_link(link)`

Save link hash database `link.csv`.

The CSV file has following fields:

- proxy type: `link.proxy`
- URL scheme: `link.url_parse.scheme`
- hostname: `link.base`
- link hash: `link.name`
- original URL: `link.url`

Parameters `link` (`darc.link.Link`) – Link object to be saved.

See also:

- `darc.const.PATH_LN`
- `darc.save._SAVE_LOCK`

`darc.save._SAVE_LOCK`: `Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving link hash database `link.csv`.

See also:

- `darc.save.save_link()`
- `darc.const.get_lock()`

1.6 Link Database

The `darc` project utilises Redis based database to provide tele-process communication.

Note: In its first implementation, the `darc` project used `Queue` to support such communication. However, as noticed when runtime, the `Queue` object will be much affected by the lack of memory.

There will be three databases, all following the save naming convention with `queue_` prefix:

- the hostname database – `queue_hostname`
- the `requests` database – `queue_requests`
- the `selenium` database – `queue.selenium`

For `queue_hostname`, it is a Redis `set` data type; and for `queue_requests` and `queue.selenium`, they are both Redis `sorted set` data type.

`darc.db.drop_hostname(link)`

Remove link from the hostname database.

The function updates the `queue_hostname` database.

Parameters `link` (`darc.link.Link`) – Link to be removed.

`darc.db.drop_requests(link)`

Remove link from the `requests` database.

The function updates the `queue_requests` database.

Parameters `link` (`darc.link.Link`) – Link to be removed.

`darc.db.drop.selenium(link)`

Remove link from the `selenium` database.

The function updates the `queue.selenium` database.

Parameters `link` (`darc.link.Link`) – Link to be removed.

`darc.db.get_lock(name, timeout=None, sleep=0.1, blocking_timeout=None, lock_class=None, thread_local=True)`

Get a lock for Redis operations.

Parameters

- **name** (`str`) – Lock name.
- **timeout** (*Optional*[`float`]) – Maximum life for the lock.
- **sleep** (`float`) – Amount of time to sleep per loop iteration when the lock is in blocking mode and another client is currently holding the lock.
- **blocking_timeout** (*Optional*[`float`]) – Maximum amount of time in seconds to spend trying to acquire the lock.
- **lock_class** (*Optional*[`redis.lock.Lock`]) – Lock implementation.
- **thread_local** (`bool`) – Whether the lock token is placed in thread-local storage.

Returns Return a new `redis.lock.Lock` object using key name that mimics the behavior of `threading.Lock`.

Return type Union[`redis.lock.Lock`, `contextlib.nullcontext`]

See Also: If `REDIS_LOCK` is `False`, returns a `contextlib.nullcontext` instead.

`darc.db.have_hostname(link)`

Check if current link is a new host.

The function checks the `queue_hostname` database.

Parameters `link` (`darc.link.Link`) – Link to check against.

Returns If such link is a new host.

Return type `bool`

`darc.db.load_requests(check=False)`

Load link from the `requests` database.

The function reads the `queue_requests` database.

Parameters `check` (`bool`) – If perform checks on loaded links, default to `CHECK`.

Returns List of loaded links from the `requests` database.

Return type List[`darc.link.Link`]

Note: At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

`darc.db.load_selenium(check=False)`

Load link from the `selenium` database.

The function reads the `queue.selenium` database.

Parameters `check` (`bool`) – If perform checks on loaded links, default to `CHECK`.

Returns List of loaded links from the `selenium` database.

Return type List[`darc.link.Link`]

Note: At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

`darc.db.redis_command(command, *args, **kwargs)`

Wrapper function for Redis command.

Parameters

- **command** (`str`) – Command name.
- ***args** – Arbitrary arguments for the Redis command.

Keyword Arguments `**kwargs` – Arbitrary keyword arguments for the Redis command.

Returns Values returned from the Redis command.

Warns `RedisCommandFailed` – Warns at each round when the command failed.

Return type Any

See also:

Between each retry, the function sleeps for `REDIS_RETRY` second(s) if such value is **NOT** None.

`darc.db.save_requests(entries, single=False, score=None, nx=False, xx=False)`

Save link to the `requests` database.

The function updates the `queue_requests` database.

Parameters

- **entries** (`List [darc.link.Link]`) – Links to be added to the `requests` database.
It can be either a `list` of links, or a single link string (if `single` set as `True`).
- **single** (`bool`) – Indicate if `entries` is a `list` of links or a single link string.
- **score** – Score to for the Redis sorted set.
- **nx** – Forces ZADD to only create new elements and not to update scores for elements that already exist.
- **xx** – Forces ZADD to only update scores of elements that already exist. New elements will not be added.

When `entries` is a list of `Link` instances, we tries to perform *bulk* update to easy the memory consumption.
The *bulk* size is defined by `BULK_SIZE`.

Notes

The `entries` will be dumped through `pickle` so that `darc` do not need to parse them again.

`darc.db.save.selenium(entries, single=False, score=None, nx=False, xx=False)`

Save link to the `selenium` database.

The function updates the `queue.selenium` database.

Parameters

- **entries** (`List [darc.link.Link]`) – Links to be added to the `selenium` database.
It can be either an `iterable` of links, or a single link string (if `single` set as `True`).
- **single** (`bool`) – Indicate if `entries` is an `iterable` of links or a single link string.
- **score** – Score to for the Redis sorted set.
- **nx** – Forces ZADD to only create new elements and not to update scores for elements that already exist.

- **xx** – Forces ZADD to only update scores of elements that already exist. New elements will not be added.

When `entries` is a list of `Link` instances, we tries to perform *bulk* update to easy the memory consumption. The *bulk* size is defined by `BULK_SIZE`.

Notes

The `entries` will be dumped through `pickle` so that `darc` do not need to parse them again.

`darc.db.BULK_SIZE: int`

Default 100

Environ `DARC_BULK_SIZE`

Bulk size for updating Redis databases.

See also:

- `darc.db.save_requests()`
- `darc.db.save_selenium()`

`darc.db.LOCK_TIMEOUT: Optional[float]`

Default 10

Environ `DARC_LOCK_TIMEOUT`

Lock blocking timeout.

Note: If is an infinit `inf`, no timeout will be applied.

See also:

Get a lock from `darc.db.get_lock()`.

`darc.db.MAX_POOL: int`

Default 1_000

Environ `DARC_MAX_POOL`

Maximum number of links loading from the database.

Note: If is an infinit `inf`, no limit will be applied.

`darc.db.REDIS_LOCK: bool`

Default `False`

Environ `DARC_REDIS_LOCK`

If use Redis (Lua) lock to ensure process/thread-safely operations.

See also:

Toggles the behaviour of `darc.db.get_lock()`.

`darc.db.REDIS_RETRY: int`

Default 10**Environ** DARC_REDIS_RETRY

Retry interval between each Redis command failure.

Note: If is an infinit `inf`, no interval will be applied.

See also:

Toggles the behaviour of `darc.db.redis_command()`.

1.7 Data Submission

The `darc` project integrates the capability of submitting fetched data and information to a web server, to support real-time cross-analysis and status display.

There are three submission events:

1. New Host Submission – `API_NEW_HOST`

Submitted in `crawler()` function call, when the crawling URL is marked as a new host.

2. Requests Submission – `API_REQUESTS`

Submitted in `crawler()` function call, after the crawling process of the URL using `requests`.

3. Selenium Submission – `API_SELENIUM`

Submitted in `loader()` function call, after the loading process of the URL using `selenium`.

`darc.submit.get_metadata(link)`

Generate metadata field.

Parameters `link` (`darc.link.Link`) – Link object to generate metadata.

Returns

The metadata from `link`.

- `url` – original URL, `link.url`
- `proxy` – proxy type, `link.proxy`
- `host` – hostname, `link.host`
- `base` – base path, `link.base`
- `name` – link hash, `link.name`

Return type `Dict[str, str]`

`darc.submit.get_robots(link)`

Read `robots.txt`.

Parameters `link` (`darc.link.Link`) – Link object to read `robots.txt`.

Returns

- If `robots.txt` exists, return the data from `robots.txt`.
 - `path` – relative path from `robots.txt` to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/robots.txt`

- data – *base64* encoded content of `robots.txt`
- If not, return `None`.

Return type `Optional[Dict[str, Union[str, ByteString]]]`

See also:

- `darc.crawl.crawler()`
- `darc.proxy.null.save_robots()`

`darc.submit.get_sitemap(link)`

Read sitemaps.

Parameters `link (darc.link.Link)` – Link object to read sitemaps.

Returns

- If sitemaps exist, return list of the data from sitemaps.
 - path – relative path from sitemap to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml`
 - data – *base64* encoded content of sitemap
- If not, return `None`.

Return type `Optional[List[Dict[str, Union[str, ByteString]]]]`

See also:

- `darc.crawl.crawler()`
- `darc.proxy.null.save_sitemap()`

`darc.submit.save_submit(domain, data)`

Save failed submit data.

Parameters

- `domain ('new_host', 'requests' or 'selenium')` – Domain of the submit data.
- `data (Dict[str, Any])` – Submit data.

See also:

- `darc.submit.PATH_API`
- `darc.submit.submit()`
- `darc.submit.submit_new_host()`
- `darc.submit.submit_requests()`
- `darc.submit.submit_selenium()`

`darc.submit.submit(api, domain, data)`

Submit data.

Parameters

- `api (str)` – API URL.
- `domain ('new_host', 'requests' or 'selenium')` – Domain of the submit data.

- **data** (*Dict[str, Any]*) – Submit data.

See also:

- `darc.submit.API_RETRY`
- `darc.submit.save_submit()`
- `darc.submit.submit_new_host()`
- `darc.submit.submit_requests()`
- `darc.submit.submit_selenium()`

`darc.submit.submit_new_host(time, link, partial=False)`

Submit new host.

When a new host is discovered, the `darc` crawler will submit the host information. Such includes `robots.txt` (if exists) and `sitemap.xml` (if any).

Parameters

- **time** (`datetime.datetime`) – Timestamp of submission.
- **link** (`darc.link.Link`) – Link object of submission.
- **partial** (`bool`) – If the data is not complete, i.e. failed when fetching `robots.txt`, `hosts.txt` and/or sitemaps.

If `API_NEW_HOST` is `None`, the data for submission will directly be save through `save_submit()`.

The data submitted should have following format:

```
{
    // partial flag - true / false
    "$PARTIAL$": ...,
    // metadata of URL
    "[metadata)": {
        // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
        "url": ...,
        // proxy type - null / tor / i2p / zeronet / freenet
        "proxy": ...,
        // hostname / netloc, c.f. ``urllib.parse.urlparse``
        "host": ...,
        // base folder, relative path (to data root path ``PATH_DATA``) in
        // container - <proxy>/<scheme>/<host>
        "base": ...,
        // sha256 of URL as name for saved files (timestamp is in ISO format)
        // JSON log as this one - <base>/<name>_<timestamp>.json
        // HTML from requests - <base>/<name>_<timestamp>_raw.html
        // HTML from selenium - <base>/<name>_<timestamp>.html
        // generic data files - <base>/<name>_<timestamp>.dat
        "name": ...
    },
    // requested timestamp in ISO format as in name of saved file
    "Timestamp": ...,
    // original URL
    "URL": ...,
    // robots.txt from the host (if not exists, then ``null``)
    "Robots": {
        // path of the file, relative path (to data root path ``PATH_DATA``) in
        // container
    }
}
```

(continues on next page)

(continued from previous page)

```
//   - <proxy>/<scheme>/<host>/robots.txt
"path": ...,
// content of the file (**base64** encoded)
"data": ...,
},
// sitemaps from the host (if none, then ``null``)
"Sitemaps": [
{
    // path of the file, relative path (to data root path ``PATH_DATA``) in container
    //   - <proxy>/<scheme>/<host>/sitemap_<name>.txt
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
},
...
],
// hosts.txt from the host (if proxy type is ``i2p``; if not exists, then ``null``)
"Hosts": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in container
    //   - <proxy>/<scheme>/<host>/hosts.txt
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
}
}
```

- [darc.proxy.i2p.get_hosts\(\)](#)

`darc.submit.submit_requests(time, link, response, session, content, html=True)`

Submit requests data.

When crawling, we'll first fetch the URL using `requests`, to check its availability and to save its HTTP headers information. Such information will be submitted to the web UI.

Parameters

- **time** (`datetime.datetime`) – Timestamp of submission.
- **link** (`darc.link.Link`) – Link object of submission.
- **response** (`requests.Response`) – Response object of submission.
- **session** (`requests.Session`) – Session object of submission.
- **content** (`bytes`) – Raw content of from the response.

- **html** (*bool*) – If current document is HTML or other files.

If *API_REQUESTS* is `None`, the data for submission will directly be save through `save_submit()`.

The data submitted should have following format:

```
{
    // metadata of URL
    "[metadata]": {
        // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
        "url": ...,
        // proxy type - null / tor / i2p / zeronet / freenet
        "proxy": ...,
        // hostname / netloc, c.f. ``urllib.parse.urlparse``
        "host": ...,
        // base folder, relative path (to data root path ``PATH_DATA``) in
        ↵container - <proxy>/<scheme>/<host>
        "base": ...,
        // sha256 of URL as name for saved files (timestamp is in ISO format)
        // JSON log as this one - <base>/<name>_<timestamp>.json
        // HTML from requests - <base>/<name>_<timestamp>_raw.html
        // HTML from selenium - <base>/<name>_<timestamp>.html
        // generic data files - <base>/<name>_<timestamp>.dat
        "name": ...
    },
    // requested timestamp in ISO format as in name of saved file
    "Timestamp": ...,
    // original URL
    "URL": ...,
    // request method
    "Method": "GET",
    // response status code
    "Status-Code": ...,
    // response reason
    "Reason": ...,
    // response cookies (if any)
    "Cookies": {
        ...
    },
    // session cookies (if any)
    "Session": {
        ...
    },
    // request headers (if any)
    "Request": {
        ...
    },
    // response headers (if any)
    "Response": {
        ...
    },
    // requested file (if not exists, then ``null``)
    "Document": {
        // path of the file, relative path (to data root path ``PATH_DATA``) in
        ↵container
        // - <proxy>/<scheme>/<host>/<name>_<timestamp>_raw.html
        // or if the document is of generic content type, i.e. not HTML
        // - <proxy>/<scheme>/<host>/<name>_<timestamp>.dat
        "path": ...
    }
}
```

(continues on next page)

(continued from previous page)

```
// content of the file (**base64** encoded)
    "data": ...,
},
// redirection history (if any)
"History": [
    // same record data as the original response
    {"...": "..."}
]
}
```

`darc.submit.submit_selenium(time, link, html, screenshot)`

Submit selenium data.

After crawling with `requests`, we'll then render the URL using `selenium` with Google Chrome and its web driver, to provide a fully rendered web page. Such information will be submitted to the web UI.

Parameters

- **time** (`datetime.datetime`) – Timestamp of submission.
- **link** ([darc.link.Link](#)) – Link object of submission.
- **html** (`str`) – HTML source of the web page.
- **screenshot** (*Optional* [`str`]) – `base64` encoded screenshot.

If `API_SELENIUM` is `None`, the data for submission will directly be save through `save_submit()`.

Note: This information is optional, only provided if the content type from `requests` is `HTML`, status code not between `400` and `600`, and `HTML` data not empty.

The data submitted should have following format:

```
{
    // metadata of URL
    "[metadata]": {
        // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
        "url": ...,
        // proxy type - null / tor / i2p / zeronet / freenet
        "proxy": ...,
        // hostname / netloc, c.f. ``urllib.parse.urlparse``
        "host": ...,
        // base folder, relative path (to data root path ``PATH_DATA``) in
        // container - <proxy>/<scheme>/<host>
        "base": ...
    }
}
```

(continues on next page)

(continued from previous page)

```
// sha256 of URL as name for saved files (timestamp is in ISO format)
//   JSON log as this one - <base>/<name>_<timestamp>.json
//   HTML from requests - <base>/<name>_<timestamp>_raw.html
//   HTML from selenium - <base>/<name>_<timestamp>.html
//   generic data files - <base>/<name>_<timestamp>.dat
"name": ...,
},
// requested timestamp in ISO format as in name of saved file
"Timestamp": ...,
// original URL
"URL": ...,
// rendered HTML document (if not exists, then ``null``)
"Document": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in ↵
    container
    // - <proxy>/<scheme>/<host>/<name>_<timestamp>.html
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
},
// web page screenshot (if not exists, then ``null``)
"Screenshot": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in ↵
    container
    // - <proxy>/<scheme>/<host>/<name>_<timestamp>.png
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
}
}
```

See also:

- [darc.submit.API_SELENIUM](#)
- [darc.submit.submit\(\)](#)
- [darc.submit.save_submit\(\)](#)
- [darc.submit.get_metadata\(\)](#)
- [darc.submit.get_html\(\)](#)
- [darc.submit.get_screenshot\(\)](#)
- [darc.crawl.loader\(\)](#)

`darc.submit.PATH_API = '{PATH_DB}/api/'`

Path to the API submission records, i.e. api folder under the root of data storage.

See also:

- [darc.const.PATH_DB](#)

`darc.submit.API_RETRY: int`

Retry times for API submission when failure.

Default 3**Environ** `API_RETRY`

`darc.submit.API_NEW_HOST: str`
API URL for `submit_new_host()`.

Default `None`

Environ `API_NEW_HOST`

`darc.submit.API_REQUESTS: str`
API URL for `submit_requests()`.

Default `None`

Environ `API_REQUESTS`

`darc.submit.API_SELENIUM: str`
API URL for `submit_selenium()`.

Default `None`

Environ `API_SELENIUM`

Note: If `API_NEW_HOST`, `API_REQUESTS` and `API_SELENIUM` is `None`, the corresponding submit function will save the JSON data in the path specified by `PATH_API`.

See also:

The `darc` provides a demo on how to implement a `darc`-compliant web backend for the data submission module. See the `demo` page for more information.

1.8 Requests Wrapper

The `darc.requests` module wraps around the `requests` module, and provides some simple interface for the `darc` project.

`darc.requests.default_user_agent(name='python-darc', proxy=None)`
Generates the default user agent.

Parameters

- `name (str)` – Base name.
- `proxy (Optional[str])` – Proxy type.

Returns User agent in format of `{name}/{darc.__version__} ({proxy} Proxy)`.

Return type `str`

`darc.requests.i2p_session(futures=False)`
I2P (.i2p) session.

Parameters `futures (bool)` – If returns a `requests_futures.FuturesSession`.

Returns The session object with I2P proxy settings.

Return type `Union[requests.Session, requests_futures.FuturesSession]`

See also:

- `darc.proxy.i2p.I2P_REQUESTS_PROXY`

`darc.requests.null_session(futures=False)`

No proxy session.

Parameters `futures` (`bool`) – If returns a `requests_futures.FuturesSession`.

Returns The session object with no proxy settings.

Return type Union[`requests.Session`, `requests_futures.FuturesSession`]

`darc.requests.request_session(link, futures=False)`

Get requests session.

Parameters

- `link` (`darc.link.Link`) – Link requesting for `requests.Session`.
- `futures` (`bool`) – If returns a `requests_futures.FuturesSession`.

Returns The session object with corresponding proxy settings.

Return type Union[`requests.Session`, `requests_futures.FuturesSession`]

Raises `UnsupportedLink` – If the proxy type of `link` if not specified in the `LINK_MAP`.

See also:

- `darc.proxy.LINK_MAP`

`darc.requests.tor_session(futures=False)`

Tor (.onion) session.

Parameters `futures` (`bool`) – If returns a `requests_futures.FuturesSession`.

Returns The session object with Tor proxy settings.

Return type Union[`requests.Session`, `requests_futures.FuturesSession`]

See also:

- `darc.proxy.tor.TOR_REQUESTS_PROXY`

1.9 Selenium Wrapper

The `darc.selenium` module wraps around the `selenium` module, and provides some simple interface for the `darc` project.

`darc.selenium.get_capabilities(type='null')`

Generate desired capabilities.

Parameters `type` (`str`) – Proxy type for capabilities.

Returns The desired capabilities for the web driver Chrome.

Raises `UnsupportedProxy` – If the proxy type is NOT `null`, `tor` or `i2p`.

Return type `dict`

See also:

- `darc.proxy.tor.TOR_SELENIUM_PROXY`
- `darc.proxy.i2p.I2P_SELENIUM_PROXY`

`darc.selenium.get_options (type='null')`

Generate options.

Parameters `type (str)` – Proxy type for options.

Returns The options for the web driver Chrome.

Return type selenium.webdriver.ChromeOptions

Raises

- `UnsupportedPlatform` – If the operation system is NOT macOS or Linux.
- `UnsupportedProxy` – If the proxy type is NOT null, tor or i2p.

See also:

- `darc.proxy.tor.TOR_PORT`
- `darc.proxy.i2p.I2P_PORT`

`darc.selenium.i2p_driver()`

I2P (.i2p) driver.

Returns The web driver object with I2P proxy settings.

Return type selenium.webdriver.Chrome

See also:

- `darc.selenium.get_options ()`
- `darc.selenium.get_capabilities ()`

`darc.selenium.null_driver()`

No proxy driver.

Returns The web driver object with no proxy settings.

Return type selenium.webdriver.Chrome

See also:

- `darc.selenium.get_options ()`
- `darc.selenium.get_capabilities ()`

`darc.selenium.request_driver(link)`

Get selenium driver.

Parameters `link` (`darc.link.Link`) – Link requesting for Chrome.

Returns The web driver object with corresponding proxy settings.

Return type `selenium.webdriver.Chrome`

Raises `UnsupportedLink` – If the proxy type of `link` if not specified in the `LINK_MAP`.

See also:

- `darc.proxy.LINK_MAP`

`darc.selenium.tor_driver()`

Tor (.onion) driver.

Returns The web driver object with Tor proxy settings.

Return type `selenium.webdriver.Chrome`

See also:

- `darc.selenium.get_options()`
- `darc.selenium.get_capabilities()`

1.10 Proxy Utilities

The `darc.proxy` module provides various proxy support to the `darc` project.

1.10.1 Bitcoin Addresses

The `darc.proxy.bitcoin` module contains the auxiliary functions around managing and processing the bitcoin addresses.

Currently, the `darc` project directly save the bitcoin addresses extracted to the data storage file `PATH` without further processing.

`darc.proxy.bitcoin.save_bitcoin(link)`

Save bitcoin address.

The function will save bitcoin address to the file as defined in `PATH`.

Parameters `link` (`darc.link.Link`) – Link object representing the bitcoin address.

`darc.proxy.bitcoin.PATH = '{PATH_MISC}/bitcoin.txt'`

Path to the data storage of bitcoin addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.bitcoin.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving bitcoin addresses `PATH`.

See also:

- `darc.const.get_lock()`

1.10.2 Data URI Schemes

The `darc.proxy.data` module contains the auxiliary functions around managing and processing the data URI schemes.

Currently, the `darc` project directly save the data URI schemes extracted to the data storage path `PATH` without further processing.

`darc.proxy.data.save_data(link)`

Save data URI.

The function will save data URIs to the data storage as defined in `PATH`.

Parameters `link(darc.link.Link)` – Link object representing the data URI.

`darc.proxy.data.PATH = '{PATH_MISC}/data/'`

Path to the data storage of data URI schemes.

See also:

- `darc.const.PATH_MISC`

1.10.3 ED2K Magnet Links

The `darc.proxy.ed2k` module contains the auxiliary functions around managing and processing the ED2K magnet links.

Currently, the `darc` project directly save the ED2K magnet links extracted to the data storage file `PATH` without further processing.

`darc.proxy.ed2k.save_ed2k(link)`

Save ed2k magnet link.

The function will save ED2K magnet link to the file as defined in `PATH`.

Parameters `link(darc.link.Link)` – Link object representing the ED2K magnet links.

`darc.proxy.ed2k.PATH = '{PATH_MISC}/ed2k.txt'`

Path to the data storage of bED2K magnet links.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.ed2k.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving ED2K magnet links `PATH`.

See also:

- `darc.const.get_lock()`

1.10.4 Freenet Proxy

The `darc.proxy.freenet` module contains the auxiliary functions around managing and processing the Freenet proxy.

`darc.proxy.freenet._freenet_bootstrap()`
Freenet bootstrap.

The bootstrap arguments are defined as `_FREENET_ARGS`.

Raises `subprocess.CalledProcessError` – If the return code of `_FREENET_PROC` is non-zero.

See also:

- `darc.proxy.freenet.freenet_bootstrap()`
- `darc.proxy.freenet.BS_WAIT`
- `darc.proxy.freenet._FREENET_BS_FLAG`
- `darc.proxy.freenet._FREENET_PROC`

`darc.proxy.freenet.freenet_bootstrap()`
Bootstrap wrapper for Freenet.

The function will bootstrap the Freenet proxy. It will retry for `FREENET_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_FREENET_BS_FLAG`.

Warns `FreenetBootstrapFailed` – If failed to bootstrap Freenet proxy.

Raises `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

See also:

- `darc.proxy.freenet._freenet_bootstrap()`
- `darc.proxy.freenet.FREENET_RETRY`
- `darc.proxy.freenet._FREENET_BS_FLAG`

The following constants are configuration through environment variables:

`darc.proxy.freenet.FREENET_PORT: int`
Port for Freenet proxy connection.

Default 8888

Environ `FREENET_PORT`

`darc.proxy.freenet.FREENET_RETRY: int`
Retry times for Freenet bootstrap when failure.

Default 3

Environ `FREENET_RETRY`

`darc.proxy.freenet.BS_WAIT: float`
Time after which the attempt to start Freenet is aborted.

Default 90

Environ `FREENET_WAIT`

Note: If not provided, there will be **NO** timeouts.

`darc.proxy.freenet.FREENET_PATH: str`

Path to the Freenet project.

Default /usr/local/src/freenet

Environ `FREENET_PATH`

`darc.proxy.freenet.FREENET_ARGS: List[str]`

Freenet bootstrap arguments for run.sh start.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

Default ''

Environ `FREENET_ARGS`

Note: The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is *root*.

The following constants are defined for internal usage:

`darc.proxy.freenet._MNG_FREENET: bool`

If manage Freenet proxy through `darc`.

Default True

Environ DARC_FREENET

`darc.proxy.freenet._FREENET_BS_FLAG: bool`

If the Freenet proxy is bootstrapped.

`darc.proxy.freenet._FREENET_PROC: subprocess.Popen`

Freenet proxy process running in the background.

`darc.proxy.freenet._FREENET_ARGS: List[str]`

Freenet proxy bootstrap arguments.

1.10.5 I2P Proxy

The `darc.proxy.i2p` module contains the auxiliary functions around managing and processing the I2P proxy.

`darc.proxy.i2p._i2p_bootstrap()`

I2P bootstrap.

The bootstrap arguments are defined as `_I2P_ARGS`.

Raises `subprocess.CalledProcessError` – If the return code of `_I2P_PROC` is non-zero.

See also:

- `darc.proxy.i2p.i2p_bootstrap()`
- `darc.proxy.i2p.BS_WAIT`
- `darc.proxy.i2p._I2P_BS_FLAG`
- `darc.proxy.i2p._I2P_PROC`

darc.proxy.i2p.**fetch_hosts** (*link*)

Fetch hosts.txt.

Parameters `link` (`darc.link.Link`) – Link object to fetch for its hosts.txt.

Returns Content of the hosts.txt file.

darc.proxy.i2p.**get_hosts** (*link*)

Read hosts.txt.

Parameters `link` (`darc.link.Link`) – Link object to read hosts.txt.

Returns

- If hosts.txt exists, return the data from hosts.txt.
 - path – relative path from hosts.txt to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/hosts.txt`
 - data – `base64` encoded content of hosts.txt
- If not, return `None`.

Return type `Optional[Dict[str, Union[str, ByteString]]]`

See also:

- `darc.submit.submit_new_host()`
- `darc.proxy.i2p.save_hosts()`

darc.proxy.i2p.**have_hosts** (*link*)

Check if hosts.txt already exists.

Parameters `link` (`darc.link.Link`) – Link object to check if hosts.txt already exists.

Returns

- If hosts.txt exists, return the path to hosts.txt, i.e. `<root>/<proxy>/<scheme>/<hostname>/hosts.txt`.
- If not, return `None`.

Return type `Optional[str]`

darc.proxy.i2p.**i2p_bootstrap**()

Bootstrap wrapper for I2P.

The function will bootstrap the I2P proxy. It will retry for `I2P_RETRY` times in case of failure.

Also, it will NOT re-bootstrap the proxy as is guaranteed by `_I2P_BS_FLAG`.

Warns `I2PBootstrapFailed` – If failed to bootstrap I2P proxy.

Raises `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

See also:

- `darc.proxy.i2p._i2p_bootstrap()`
- `darc.proxy.i2p.I2P_RETRY`
- `darc.proxy.i2p._I2P_BS_FLAG`

darc.proxy.i2p.**read_hosts** (*text, check=False*)

Read hosts.txt.

Parameters

- **text** (`str`) – Content of `hosts.txt`.
- **check** (`bool`) – If perform checks on extracted links, default to `CHECK`.

Returns List of links extracted.

Return type `List[darc.link.Link]`

`darc.proxy.i2p.save_hosts(link, text)`

Save `hosts.txt`.

Parameters

- **link** (`darc.link.Link`) – Link object of `hosts.txt`.
- **text** (`str`) – Content of `hosts.txt`.

Returns Saved path to `hosts.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/hosts.txt`.

Return type `str`

See also:

- `darc.save.sanitise()`

`darc.proxy.i2p.I2P_REQUESTS_PROXY: Dict[str, Any]`

Proxy for I2P sessions.

See also:

- `darc.requests.i2p_session()`

`darc.proxy.i2p.I2P_SELENIUM_PROXY: selenium.webdriver.common.proxy.Proxy`

Proxy for I2P web drivers.

See also:

- `darc.selenium.i2p_driver()`

The following constants are configuration through environment variables:

`darc.proxy.i2p.I2P_PORT: int`

Port for I2P proxy connection.

Default 4444

Environ `I2P_PORT`

`darc.proxy.i2p.I2P_RETRY: int`

Retry times for I2P bootstrap when failure.

Default 3

Environ `I2P_RETRY`

`darc.proxy.i2p.BS_WAIT: float`

Time after which the attempt to start I2P is aborted.

Default 90

Environ `I2P_WAIT`

Note: If not provided, there will be **NO** timeouts.

`darc.proxy.i2p.I2P_ARGS: List[str]`
I2P bootstrap arguments for i2prouter start.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

Default ''

Environ `I2P_ARGS`

Note: The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is *root*.

The following constants are defined for internal usage:

`darc.proxy.i2p._MNG_I2P: bool`
If manage I2P proxy through `darc`.

Default `True`

Environ `DARC_I2P`

`darc.proxy.i2p._I2P_BS_FLAG: bool`
If the I2P proxy is bootstrapped.

`darc.proxy.i2p._I2P_PROC: subprocess.Popen`
I2P proxy process running in the background.

`darc.proxy.i2p._I2P_ARGS: List[str]`
I2P proxy bootstrap arguments.

1.10.6 IRC Addresses

The `darc.proxy.irc` module contains the auxiliary functions around managing and processing the IRC addresses.

Currently, the `darc` project directly save the IRC addresses extracted to the data storage file `PATH` without further processing.

`darc.proxy.irc.save_irc(link)`
Save IRC address.

The function will save IRC address to the file as defined in `PATH`.

Parameters `link(darc.link.Link)` – Link object representing the IRC address.

`darc.proxy.irc.PATH = '{PATH_MISC}/irc.txt'`
Path to the data storage of IRC addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.irc.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving IRC addresses `PATH`.

See also:

- `darc.const.get_lock()`

1.10.7 Magnet Links

The `darc.proxy.magnet` module contains the auxiliary functions around managing and processing the magnet links.

Currently, the `darc` project directly save the magnet links extracted to the data storage file `PATH` without further processing.

`darc.proxy.magnet.save_magnet(link)`

Save magnet link.

The function will save magnet link to the file as defined in `PATH`.

Parameters `link` (`darc.link.Link`) – Link object representing the magnet link

`darc.proxy.magnet.PATH = '{PATH_MISC}/magnet.txt'`

Path to the data storage of magnet links.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.magnet.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving magnet links `PATH`.

See also:

- `darc.const.get_lock()`

1.10.8 Email Addresses

The `darc.proxy.mail` module contains the auxiliary functions around managing and processing the email addresses.

Currently, the `darc` project directly save the email addresses extracted to the data storage file `PATH` without further processing.

`darc.proxy.mail.save_mail(link)`

Save email address.

The function will save email address to the file as defined in `PATH`.

Parameters `link` (`darc.link.Link`) – Link object representing the email address.

`darc.proxy.mail.PATH = '{PATH_MISC}/mail.txt'`

Path to the data storage of email addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.mail.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving email addresses `PATH`.

See also:

- `darc.const.get_lock()`

1.10.9 No Proxy

The `darc.proxy.null` module contains the auxiliary functions around managing and processing normal websites with no proxy.

`darc.proxy.null.fetch_sitemap(link)`

Fetch sitemap.

The function will first fetch the `robots.txt`, then fetch the sitemaps accordingly.

Parameters `link` (`darc.link.Link`) – Link object to fetch for its sitemaps.

Returns Contents of `robots.txt` and sitemaps.

See also:

- `darc.proxy.null.read_robots()`
- `darc.proxy.null.read_sitemap()`
- `darc.parse.get_sitemap()`

`darc.proxy.null.get_sitemap(link, text, host=None)`

Fetch link to other sitemaps from a sitemap.

Parameters

- `link` (`darc.link.Link`) – Original link to the sitemap.
- `text` (`str`) – Content of the sitemap.
- `host` (`Optional[str]`) – Hostname of the URL to the sitemap, the value may not be same as in `link`.

Returns List of link to sitemaps.

Return type `List[darc.link.Link]`

Note: As specified in the sitemap protocol, it may contain links to other sitemaps.*⁰

`darc.proxy.null.have_robots(link)`

Check if `robots.txt` already exists.

Parameters `link` (`darc.link.Link`) – Link object to check if `robots.txt` already exists.

Returns

- If `robots.txt` exists, return the path to `robots.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/robots.txt`.
- If not, return `None`.

Return type `Optional[str]`

`darc.proxy.null.have_sitemap(link)`

Check if sitemap already exists.

Parameters `link` (`darc.link.Link`) – Link object to check if sitemap already exists.

Returns

⁰ <https://www.sitemaps.org/protocol.html#index>

- If sitemap exists, return the path to the sitemap, i.e. <root>/<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml.
- If not, return `None`.

Return type `Optional[str]`

`darc.proxy.null.read_robots(link, text, host=None)`

Read `robots.txt` to fetch link to sitemaps.

Parameters

- `link (darc.link.Link)` – Original link to `robots.txt`.
- `text (str)` – Content of `robots.txt`.
- `host (Optional[str])` – Hostname of the URL to `robots.txt`, the value may not be same as in `link`.

Returns List of link to sitemaps.

Return type `List[darc.link.Link]`

Note: If the link to sitemap is not specified in `robots.txt`⁰, the fallback link `/sitemap.xml` will be used.

`darc.proxy.null.read_sitemap(link, text, check=False)`

Read sitemap.

Parameters

- `link (darc.link.Link)` – Original link to the sitemap.
- `text (str)` – Content of the sitemap.
- `check (bool)` – If perform checks on extracted links, default to `CHECK`.

Returns List of links extracted.

Return type `List[darc.link.Link]`

See also:

- `darc.parse._check()`
- `darc.parse._check_ng()`

`darc.proxy.null.save_invalid(link)`

Save link with invalid scheme.

The function will save link with invalid scheme to the file as defined in `PATH`.

Parameters `link (darc.link.Link)` – Link object representing the link with invalid scheme.

`darc.proxy.null.save_robots(link, text)`

Save `robots.txt`.

Parameters

- `link (darc.link.Link)` – Link object of `robots.txt`.
- `text (str)` – Content of `robots.txt`.

⁰ https://www.sitemaps.org/protocol.html#submit_robots

Returns Saved path to `robots.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/robots.txt`.

Return type `str`

See also:

- `darc.save.sanitise()`

`darc.proxy.null.save_sitemap(link, text)`

Save sitemap.

Parameters

- `link (darc.link.Link)` – Link object of sitemap.
- `text (str)` – Content of sitemap.

Returns Saved path to sitemap, i.e. `<root>/<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml`.

Return type `str`

See also:

- `darc.save.sanitise()`

`darc.proxy.null.PATH = '{PATH_MISC}/invalid.txt'`

Path to the data storage of links with invalid scheme.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.null.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving links with invalid scheme `PATH`.

See also:

- `darc.const.get_lock()`

1.10.10 JavaScript Links

The `darc.proxy.script` module contains the auxiliary functions around managing and processing the JavaScript links.

Currently, the `darc` project directly save the JavaScript links extracted to the data storage path `PATH` without further processing.

`darc.proxy.script.save_script(link)`

Save JavaScript link.

The function will save JavaScript link to the file as defined in `PATH`.

Parameters `link (darc.link.Link)` – Link object representing the JavaScript link.

`darc.proxy.script.PATH = '{PATH_MISC}/script.txt'`

Path to the data storage of bitcoin addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.script.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving JavaScript links `PATH`.

See also:

- `darc.const.get_lock()`

1.10.11 Telephone Numbers

The `darc.proxy.tel` module contains the auxiliary functions around managing and processing the telephone numbers.

Currently, the `darc` project directly save the telephone numbers extracted to the data storage file `PATH` without further processing.

`darc.proxy.tel.save_tel(link)`

Save telephone number.

The function will save telephone number to the file as defined in `PATH`.

Parameters `link` (`darc.link.Link`) – Link object representing the telephone number.

`darc.proxy.tel.PATH = '{PATH_MISC}/tel.txt'`

Path to the data storage of bitcoin addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.tel.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`
I/O lock for saving telephone numbers `PATH`.

See also:

- `darc.const.get_lock()`

1.10.12 Tor Proxy

The `darc.proxy.tor` module contains the auxiliary functions around managing and processing the Tor proxy.

`darc.proxy.tor._tor_bootstrap()`

Tor bootstrap.

The bootstrap configuration is defined as `_TOR_CONFIG`.

If `TOR_PASS` not provided, the function will request for it.

See also:

- `darc.proxy.tor.tor_bootstrap()`
- `darc.proxy.tor.BS_WAIT`
- `darc.proxy.tor.TOR_PASS`
- `darc.proxy.tor._TOR_BS_FLAG`

- `darc.proxy.tor._TOR_PROC`
- `darc.proxy.tor._TOR_CTRL`

`darc.proxy.tor.print_bootstrap_lines(line)`
Print Tor bootstrap lines.

Parameters `line (str)` – Tor bootstrap line.

`darc.proxy.tor.renew_tor_session()`
Renew Tor session.

`darc.proxy.tor.tor_bootstrap()`
Bootstrap wrapper for Tor.

The function will bootstrap the Tor proxy. It will retry for `TOR_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_TOR_BS_FLAG`.

Warns `TorBootstrapFailed` – If failed to bootstrap Tor proxy.

See also:

- `darc.proxy.tor._tor_bootstrap()`
- `darc.proxy.tor.TOR_RETRY`
- `darc.proxy.tor._TOR_BS_FLAG`

`darc.proxy.tor.TOR_REQUESTS_PROXY: Dict[str, Any]`
Proxy for Tor sessions.

See also:

- `darc.requests.tor_session()`

`darc.proxy.tor.TOR_SELENIUM_PROXY: selenium.webdriver.common.proxy.Proxy`
Proxy for Tor web drivers.

See also:

- `darc.selenium.tor_driver()`

The following constants are configuration through environment variables:

`darc.proxy.tor.TOR_PORT: int`
Port for Tor proxy connection.

Default 9050

Environ `TOR_PORT`

`darc.proxy.tor.TOR_CTRL: int`
Port for Tor controller connection.

Default 9051

Environ `TOR_CTRL`

`darc.proxy.tor.TOR_PASS: str`
Tor controller authentication token.

Default `None`

Environ `TOR_PASS`

Note: If not provided, it will be requested at runtime.

`darc.proxy.tor.TOR_RETRY: int`

Retry times for Tor bootstrap when failure.

Default 3

Environ `TOR_RETRY`

`darc.proxy.tor.BS_WAIT: float`

Time after which the attempt to start Tor is aborted.

Default 90

Environ `TOR_WAIT`

Note: If not provided, there will be **NO** timeouts.

`darc.proxy.tor.TOR_CFG: Dict[str, Any]`

Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

Default {}

Environ `TOR_CFG`

Note: If provided, it will be parsed from a JSON encoded string.

The following constants are defined for internal usage:

`darc.proxy.tor._MNG_TOR: bool`

If manage Tor proxy through `darc`.

Default True

Environ `DARC_TOR`

`darc.proxy.tor._TOR_BS_FLAG: bool`

If the Tor proxy is bootstrapped.

`darc.proxy.tor._TOR_PROC: subprocess.Popen`

Tor proxy process running in the background.

`darc.proxy.tor._TOR_CTRL: stem.control.Controller`

Tor controller process (`stem.control.Controller`) running in the background.

`darc.proxy.tor._TOR_CONFIG: List[str]`

Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

1.10.13 ZeroNet Proxy

The `darc.proxy.zeronet` module contains the auxiliary functions around managing and processing the ZeroNet proxy.

`darc.proxy.zeronet._zeronet_bootstrap()`
ZeroNet bootstrap.

The bootstrap arguments are defined as `_ZERONET_ARGS`.

Raises `subprocess.CalledProcessError` – If the return code of `_ZERONET_PROC` is non-zero.

See also:

- `darc.proxy.zeronet.zeronet_bootstrap()`
- `darc.proxy.zeronet.BS_WAIT`
- `darc.proxy.zeronet._ZERONET_BS_FLAG`
- `darc.proxy.zeronet._ZERONET_PROC`

`darc.proxy.zeronet.zeronet_bootstrap()`
Bootstrap wrapper for ZeroNet.

The function will bootstrap the ZeroNet proxy. It will retry for `ZERONET_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_ZERONET_BS_FLAG`.

Warns `ZeroNetBootstrapFailed` – If failed to bootstrap ZeroNet proxy.

Raises `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

See also:

- `darc.proxy.zeronet._zeronet_bootstrap()`
- `darc.proxy.zeronet.ZERONET_RETRY`
- `darc.proxy.zeronet._ZERONET_BS_FLAG`

The following constants are configuration through environment variables:

`darc.proxy.zeronet.ZERONET_PORT: int`
Port for ZeroNet proxy connection.

Default 43110

Environ `ZERONET_PORT`

`darc.proxy.zeronet.ZERONET_RETRY: int`
Retry times for ZeroNet bootstrap when failure.

Default 3

Environ `ZERONET_RETRY`

`darc.proxy.zeronet.BS_WAIT: float`
Time after which the attempt to start ZeroNet is aborted.

Default 90

Environ `ZERONET_WAIT`

Note: If not provided, there will be **NO** timeouts.

`darc.proxy.zeronet.ZERONET_PATH: str`

Path to the ZeroNet project.

Default /usr/local/src/zeronet

Environ ZERONET_PATH

`darc.proxy.zeronet.ZERONET_ARGS: List[str]`

ZeroNet bootstrap arguments for run.sh start.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

Default ''

Environ ZERONET_ARGS

Note: The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is *root*.

The following constants are defined for internal usage:

`darc.proxy.zeronet._MNG_ZERONET: bool`

If manage ZeroNet proxy through `darc`.

Default True

Environ DARC_ZERONET

`darc.proxy.zeronet._ZERONET_BS_FLAG: bool`

If the ZeroNet proxy is bootstrapped.

`darc.proxy.zeronet._ZERONET_PROC: subprocess.Popen`

ZeroNet proxy process running in the background.

`darc.proxy.zeronet._ZERONET_ARGS: List[str]`

ZeroNet proxy bootstrap arguments.

To tell the `darc` project which proxy settings to be used for the `requests.Session` objects and WebDriver objects, you can specify such information in the `darc.proxy.LINK_MAP` mapping dictionary.

`darc.proxy.LINK_MAP: DefaultDict[str, Tuple[types.FunctionType, types.FunctionType]]`

```
LINK_MAP = collections.defaultdict(
    lambda: (darc.requests.null_session, darc.selenium.null_driver),
    dict(
        tor=(darc.requests.tor_session, darc.selenium.tor_driver),
        i2p=(darc.requests.i2p_session, darc.selenium.i2p_driver),
    )
)
```

The mapping dictionary for proxy type to its corresponding `requests.Session` factory function and WebDriver factory function.

The fallback value is the no proxy `requests.Session` object (`null_session()`) and WebDriver object (`null_driver()`).

See also:

- `darc.requests` – `requests.Session` factory functions
- `darc.selenium` – WebDriver factory functions

1.11 Sites Customisation

As websites may have authentication requirements, etc., over its content, the `darc.sites` module provides sites customisation hooks to both `requests` and `selenium` crawling processes.

1.11.1 Default Hooks

The `darc.sites.default` module is the fallback for sites customisation.

`darc.sites.default.crawler(session, link)`

Default crawler hook.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Returns The final response object with crawled data.

Return type `requests.Response`

See also:

- `darc.crawl.crawler()`

`darc.sites.default.loader(driver, link)`

Default loader hook.

When loading, if `SE_WAIT` is a valid time lapse, the function will sleep for such time to wait for the page to finish loading contents.

Parameters

- `driver` (`selenium.webdriver.Chrome`) – Web driver object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be loaded.

Returns The web driver object with loaded data.

Return type `selenium.webdriver.Chrome`

Note: Internally, selenium will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

See also:

- `darc.crawl.loader()`
- `darc.const.SE_WAIT`

```
# -*- coding: utf-8 -*-
"""Default Hooks
=====

The :mod:`darc.sites.default` module is the fallback for sites
customisation.

"""

import time

import darc.typing as typing
from darc.const import SE_WAIT
from darc.link import Link

def crawler(session: typing.Session, link: Link) -> typing.Response:
    """Default crawler hook.

    Args:
        session (requests.Session): Session object with proxy settings.
        link: Link object to be crawled.

    Returns:
        requests.Response: The final response object with crawled data.

    See Also:
        * :func:`darc.crawl.crawler`

    """
    response = session.get(link.url, allow_redirects=True)
    return response

def loader(driver: typing.Driver, link: Link) -> typing.Driver:
    """Default loader hook.

    When loading, if :data:`~darc.const.SE_WAIT` is a valid time lapse,
    the function will sleep for such time to wait for the page to finish
    loading contents.

    Args:
        driver (selenium.webdriver.Chrome): Web driver object with proxy settings.
        link: Link object to be loaded.

    Returns:
        selenium.webdriver.Chrome: The web driver object with loaded data.

    Note:
        Internally, :mod:`selenium` will wait for the browser to finish
        loading the pages before return (i.e. the web API event
        |event|_). However, some extra scripts may take more time
        running after the event.

        .. |event| replace:: ``DOMContentLoaded``
        .. _event: https://developer.mozilla.org/en-US/docs/Web/API/Window/
        ↪DOMContentLoaded_event

```

(continues on next page)

(continued from previous page)

```

See Also:
    * :func:`darc.crawl.loader`
    * :data:`darc.const.SE_WAIT`

driver.get(link.url)

# wait for page to finish loading
if SE_WAIT is not None:
    time.sleep(SE_WAIT)

return driver

```

1.11.2 Bitcoin Addresses

The `darc.sites.bitcoin` module is customised to handle bitcoin addresses.

`darc.sites.bitcoin.crawler(session, link)`

Crawler hook for bitcoin addresses.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type NoReturn

`darc.sites.bitcoin.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- `driver` (`NewType.<locals>.new_type`) –
- `link` (`darc.link.Link`) –

Return type NoReturn

1.11.3 Data URI Schemes

The `darc.sites.data` module is customised to handle data URI schemes.

`darc.sites.data.crawler(session, link)`

Crawler hook for data URIs.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type NoReturn

`darc.sites.data.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- `driver` (`NewType.<locals>.new_type`) –
- `link` (`darc.link.Link`) –

Return type `NoReturn`

1.11.4 ED2K Magnet Links

The `darc.sites.ed2k` module is customised to handle ED2K magnet links.

`darc.sites.ed2k.crawler(session, link)`

Crawler hook for ED2K magnet links.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type `NoReturn`

`darc.sites.ed2k.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- `driver` (`NewType.<locals>.new_type`) –
- `link` (`darc.link.Link`) –

Return type `NoReturn`

1.11.5 IRC Addresses

The `darc.sites.script` module is customised to handle IRC addresses.

`darc.sites.irc.crawler(session, link)`

Crawler hook for IRC addresses.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type `NoReturn`

`darc.sites.irc.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- **driver** (*NewType.<locals>.new_type*) –
- **link** ([darc.link.Link](#)) –

Return type NoReturn

1.11.6 Magnet Links

The [darc.sites.magnet](#) module is customised to handle magnet links.

`darc.sites.magnet.crawler(session, link)`

Crawler hook for magnet links.

Parameters

- **session** ([requests.Session](#)) – Session object with proxy settings.
- **link** ([darc.link.Link](#)) – Link object to be crawled.

Raises [`LinkNoReturn`](#) – This link has no return response.

Return type NoReturn

`darc.sites.magnet.loader(driver, link)`

Not implemented.

Raises [`LinkNoReturn`](#) – This hook is not implemented.

Parameters

- **driver** (*NewType.<locals>.new_type*) –
- **link** ([darc.link.Link](#)) –

Return type NoReturn

1.11.7 Email Addresses

The [darc.sites.mail](#) module is customised to handle email addresses.

`darc.sites.mail.crawler(session, link)`

Crawler hook for email addresses.

Parameters

- **session** ([requests.Session](#)) – Session object with proxy settings.
- **link** ([darc.link.Link](#)) – Link object to be crawled.

Raises [`LinkNoReturn`](#) – This link has no return response.

Return type NoReturn

`darc.sites.mail.loader(driver, link)`

Not implemented.

Raises [`LinkNoReturn`](#) – This hook is not implemented.

Parameters

- **driver** (*NewType.<locals>.new_type*) –
- **link** ([darc.link.Link](#)) –

Return type NoReturn

1.11.8 JavaScript Links

The `darc.sites.script` module is customised to handle JavaScript links.

`darc.sites.script.crawler(session, link)`

Crawler hook for JavaScript links.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type NoReturn

`darc.sites.script.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- `driver` (`NewType.<locals>.new_type`) –
- `link` (`darc.link.Link`) –

Return type NoReturn

1.11.9 Telephone Numbers

The `darc.sites.script` module is customised to handle telephone numbers.

`darc.sites.tel.crawler(session, link)`

Crawler hook for telephone numbers.

Parameters

- `session` (`requests.Session`) – Session object with proxy settings.
- `link` (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

Return type NoReturn

`darc.sites.tel.loader(driver, link)`

Not implemented.

Raises `LinkNoReturn` – This hook is not implemented.

Parameters

- `driver` (`NewType.<locals>.new_type`) –
- `link` (`darc.link.Link`) –

Return type NoReturn

To customise behaviours over `requests`, your sites customisation module should have a `crawler()` function, e.g. `crawler()`.

The function takes the `requests.Session` object with proxy settings and a `Link` object representing the link to be crawled, then returns a `requests.Response` object containing the final data of the crawling process.

`darc.sites.crawler_hook(link, session)`

Customisation as to `requests` sessions.

Parameters

- `link (darc.link.Link)` – Link object to be crawled.
- `session (requests.Session)` – Session object with proxy settings.

Returns The final response object with crawled data.

Return type `requests.Response`

See also:

- `darc.sites.SITE_MAP`
- `darc.sites._get_spec()`
- `darc.crawl.crawler()`

To customise behaviours over `selenium`, your sites customisation module should have a `loader()` function, e.g. `loader()`.

The function takes the `WebDriver` object with proxy settings and a `Link` object representing the link to be loaded, then returns the `WebDriver` object containing the final data of the loading process.

`darc.sites.loader_hook(link, driver)`

Customisation as to `selenium` drivers.

Parameters

- `link (darc.link.Link)` – Link object to be loaded.
- `driver (selenium.webdriver.Chrome)` – Web driver object with proxy settings.

Returns The web driver object with loaded data.

Return type `selenium.webdriver.Chrome`

See also:

- `darc.sites.SITE_MAP`
- `darc.sites._get_spec()`
- `darc.crawl.loader()`

To tell the `darc` project which sites customisation module it should use for a certain hostname, you can register such module to the `SITEMAP` mapping dictionary.

`darc.sites.SITEMAP: DefaultDict[str, str]`

```
SITEMAP = collections.defaultdict(lambda: 'default', {
    # 'www.sample.com': 'sample',  # darc.sites.sample
})
```

The mapping dictionary for hostname to sites customisation modules.

The fallback value is `default`, c.f. `darc.sites.default`.

`darc.sites._get_spec(link)`

Load spec if any.

If the sites customisation failed to import, it will fallback to the default hooks, `default`.

Parameters `link` (`darc.link.Link`) – Link object to fetch sites customisation module.

Returns The sites customisation module.

Return type `types.ModuleType`

Warns `SiteNotFoundWarning` – If the sites customisation failed to import.

See also:

- `darc.sites.SITEMAP`

1.12 Module Constants

1.12.1 Auxiliary Function

`darc.const.getpid()`

Get process ID.

The process ID will be saved under the `PATH_DB` folder, in a file named `darc.pid`. If no such file exists, `-1` will be returned.

Returns The process ID.

Return type `int`

See also:

- `darc.const.PATH_ID`

`darc.const.get_lock()`

Get a lock.

Returns Lock context based on `FLAG_MP` and `FLAG_TH`.

Return type Union[multiprocessing.context.BaseContext.Lock, _thread.allocate_lock, contextlib.nullcontext]

1.12.2 General Configurations

`darc.const.REBOOT: bool`

If exit the program after first round, i.e. crawled all links from the `requests` link database and loaded all links from the `selenium` link database.

This can be useful especially when the capacity is limited and you wish to save some space before continuing next round. See [Docker integration](#) for more information.

Default `False`

Environ `DARC_REBOOT`

darc.const.DEBUG: bool

If run the program in debugging mode.

Default False**Environ** DARC_DEBUG**darc.const.VERBOSE: bool**

If run the program in verbose mode. If `DEBUG` is True, then the verbose mode will be always enabled.

Default False**Environ** DARC_VERBOSE**darc.const.FORCE: bool**

If ignore robots.txt rules when crawling (c.f. `crawler()`).

Default False**Environ** DARC_FORCE**darc.const.CHECK: bool**

If check proxy and hostname before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

If `CHECK_NG` is True, then this environment variable will be always set as True.

Default False**Environ** DARC_CHECK**darc.const.CHECK_NG: bool**

If check content type through HEAD requests before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

Default False**Environ** DARC_CHECK_CONTENT_TYPE**darc.const.ROOT: str**

The root folder of the project.

darc.const.CWD = '.'

The current working direcory.

darc.const.DARC_CPU: int

Number of concurrent processes. If not provided, then the number of system CPUs will be used.

Default None**Environ** DARC_CPU**darc.const.FLAG_MP: bool**

If enable *multiprocessing* support.

Default True**Environ** DARC_MULTIPROCESSING**darc.const.FLAG_TH: bool**

If enable *multithreading* support.

Default False**Environ** DARC_MULTITHREADING

Note: *FLAG_MP* and *FLAG_TH* can NOT be toggled at the same time.

`darc.const.DARC_USER: str`

Non-root user for proxies.

Default current login user (c.f. `getpass.getuser()`)

Environ `DARC_USER`

1.12.3 Data Storage

`darc.const.REDIS: redis.Redis`

URL to the Redis database.

Default `redis://127.0.0.1`

Environ `REDIS_URL`

See also:

See `darc.db` for more information about Redis database integration.

`darc.const.PATH_DB: str`

Path to data storage.

Default `data`

Environ `PATH_DATA`

See also:

See `darc.save` for more information about source saving.

`darc.const.PATH_MISC = '{PATH_DB}/misc/'`

Path to miscellaneous data storage, i.e. `misc` folder under the root of data storage.

See also:

- `darc.const.PATH_DB`

`darc.const.PATH_LN = '{PATH_DB}/link.csv'`

Path to the link CSV file, `link.csv`.

See also:

- `darc.const.PATH_DB`
- `darc.save.save_link`

`darc.const.PATH_ID = '{PATH_DB}/darc.pid'`

Path to the process ID file, `darc.pid`.

See also:

- `darc.const.PATH_DB`
- `darc.const.getpid()`

1.12.4 Web Crawlers

`darc.const.DARC_WAIT: Optional[float]`

Time interval between each round when the `requests` and/or selenium database are empty.

Default 60

Environ `DARC_WAIT`

`darc.const.TIME_CACHE: float`

Time delta for caches in seconds.

The `darc` project supports *caching* for fetched files. `TIME_CACHE` will specify for how long the fetched files will be cached and **NOT** fetched again.

Note: If `TIME_CACHE` is `None` then caching will be marked as *forever*.

Default 60

Environ `TIME_CACHE`

`darc.const.SE_WAIT: float`

Time to wait for selenium to finish loading pages.

Note: Internally, selenium will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

Default 60

Environ `SE_WAIT`

`darc.const.SE_EMPTY = '<html><head></head><body></body></html>'`

The empty page from selenium.

See also:

- `darc.crawl.loader()`

1.12.5 White / Black Lists

`darc.const.LINK_WHITE_LIST: List[re.Pattern]`

White list of hostnames should be crawled.

Default []

Environ `LINK_WHITE_LIST`

Note: Regular expressions are supported.

`darc.const.LINK_BLACK_LIST: List[re.Pattern]`

Black list of hostnames should be crawled.

Default []

Environ `LINK_BLACK_LIST`

Note: Regular expressions are supported.

`darc.const.LINK_FALLBACK: bool`

Fallback value for `match_host()`.

Default `False`

Environ `LINK_FALLBACK`

`darc.const.MIME_WHITE_LIST: List[re.Pattern]`

White list of content types should be crawled.

Default `[]`

Environ `MIME_WHITE_LIST`

Note: Regular expressions are supported.

`darc.const.MIME_BLACK_LIST: List[re.Pattern]`

Black list of content types should be crawled.

Default `[]`

Environ `MIME_BLACK_LIST`

Note: Regular expressions are supported.

`darc.const.MIME_FALLBACK: bool`

Fallback value for `match_mime()`.

Default `False`

Environ `MIME_FALLBACK`

`darc.const.PROXY_WHITE_LIST: List[str]`

White list of proxy types should be crawled.

Default `[]`

Environ `PROXY_WHITE_LIST`

Note: The proxy types are **case insensitive**.

`darc.const.PROXY_BLACK_LIST: List[str]`

Black list of proxy types should be crawled.

Default `[]`

Environ `PROXY_BLACK_LIST`

Note: The proxy types are **case insensitive**.

`darc.const.PROXY_FALLBACK: bool`

Fallback value for `match_proxy()`.

Default `False`

Environ `PROXY_FALLBACK`

1.13 Custom Exceptions

The `render_error()` function can be used to render multi-line error messages with `stem.util.term` colours.

The `darc` project provides following custom exceptions:

- `LinkNoReturn`
- `UnsupportedLink`
- `UnsupportedPlatform`
- `UnsupportedProxy`

The `darc` project provides following custom exceptions:

- `TorBootstrapFailed`
- `I2PBootstrapFailed`
- `ZeroNetBootstrapFailed`
- `FreenetBootstrapFailed`
- `APIRequestFailed`
- `SiteNotFoundWarning`
- `LockWarning`
- `TorRenewFailed`
- `RedisCommandFailed`

exception `darc.error.APIRequestFailed`

Bases: `Warning`

API submit failed.

exception `darc.error.FreenetBootstrapFailed`

Bases: `Warning`

Freenet bootstrap process failed.

exception `darc.error.I2PBootstrapFailed`

Bases: `Warning`

I2P bootstrap process failed.

exception `darc.error.LinkNoReturn`

Bases: `Exception`

The link has no return value from the hooks.

exception `darc.error.LockWarning`

Bases: `Warning`

Failed to acquire Redis lock.

```
exception darc.error.RedisCommandFailed
Bases: Warning

Redis command execution failed.

exception darc.error.SiteNotFoundWarning
Bases: ImportWarning

Site customisation not found.

exception darc.error.TorBootstrapFailed
Bases: Warning

Tor bootstrap process failed.

exception darc.error.TorRenewFailed
Bases: Warning

Tor renew request failed.

exception darc.error.UnsupportedLink
Bases: Exception

The link is not supported.

exception darc.error.UnsupportedPlatform
Bases: Exception

The platform is not supported.

exception darc.error.UnsupportedProxy
Bases: Exception

The proxy is not supported.

exception darc.error.ZeroNetBootstrapFailed
Bases: Warning

ZeroNet bootstrap process failed.
```

`darc.error.render_error(message, colour)`
Render error message.

The function wraps the `stem.util.term.format()` function to provide multi-line formatting support.

Parameters

- `message (str)` – Multi-line message to be rendered with `colour`.
- `colour (stem.util.term.Color)` – Front colour of text, c.f. `stem.util.term.Color`.

Returns The rendered error message.

Return type `str`

As the websites can be sometimes irritating for their anti-robots verification, login requirements, etc., the `darc` project also provides hooks to customise crawling behaviours around both `requests` and `selenium`.

See also:

Such customisation, as called in the `darc` project, site hooks, is site specific, user can set up your own hooks unto a certain site, c.f. `darc.sites` for more information.

Still, since the network is a world full of mysteries and miracles, the speed of crawling will much depend on the response speed of the target website. To boost up, as well as meet the system capacity, the `darc` project introduced multiprocessing, multithreading and the fallback slowest single-threaded solutions when crawling.

Note: When rendering the target website using selenium powered by the renown Google Chrome, it will require much memory to run. Thus, the three solutions mentioned above would only toggle the behaviour around the use of selenium.

To keep the `darc` project as it is a swiss army knife, only the main entrypoint function `darc.process.process()` is exported in global namespace (and renamed to `darc.darc()`), see below:

`darc.darc(worker)`

Main process.

The function will register `_signal_handler()` for SIGTERM, and start the main process of the `darc` darkweb crawlers.

Parameters `worker` (`Literal[crawler, loader]`) – Worker process type.

Raises `ValueError` – If `worker` is not a valid value.

Before starting the workers, the function will start proxies through

- `darc.proxy.tor.tor_proxy()`
- `darc.proxy.i2p.i2p_proxy()`
- `darc.proxy.zeronet.zeronet_proxy()`
- `darc.proxy.freenet.freenet_proxy()`

The general process can be described as following for `workers` of `crawler` type:

1. `process_crawler()`: obtain URLs from the `requests` link database (c.f. `load_requests()`), and feed such URLs to `crawler()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `crawler()`: parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, `darc` will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`). Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, `darc` will check if allowed to crawl the URL.

Note: The root path (e.g. `/` in `https://www.example.com/`) will always be crawled ignoring `robots.txt`.

At this point, `darc` will call the customised hook function from `darc.sites` to crawl and get the final response object. `darc` will save the session cookies and header information, using `save_headers()`.

Note: If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped.

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If NOT, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for *workers* of `loader` type:

1. `process_loader()`: in the meanwhile, `darc` will obtain URLs from the selenium link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` is `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original Chrome object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

If in reboot mode, i.e. `REBOOT` is `True`, the function will exit after first round. If not, it will renew the Tor connections (if bootstrapped), c.f. `renew_tor_session()`, and start another round.

DOCKER INTEGRATION

The `darc` project is integrated with Docker and Compose. Though published to [Docker Hub](#), you can still build by yourself.

Important: The debug image contains miscellaneous documents, i.e. whole repository in it; and pre-installed some useful tools for debugging, such as IPython, etc.

The Docker image is based on [Ubuntu Bionic](#) (18.04 LTS), setting up all Python dependencies for the `darc` project, installing [Google Chrome](#) (version 79.0.3945.36) and corresponding [ChromeDriver](#), as well as installing and configuring [Tor](#), [I2P](#), [ZeroNet](#), [FreeNet](#), [NoIP](#) proxies.

Note: NoIP is currently not fully integrated in the `darc` due to misunderstanding in the configuration process. Contributions are welcome.

When building the image, there is an *optional* argument for setting up a *non-root* user, c.f. environment variable `DARC_USER` and module constant `DARC_USER`. By default, the username is `darc`.

```

```
# network settings
networks:
  darc:
    driver: bridge
```

Note: Should you wish to run *darc* in reboot mode, i.e. set *DARC_REBOOT* and/or *REBOOT* as *True*, you may wish to change the entrypoint to

```
bash /app/run.sh
```

where *run.sh* is a shell script wraps around *darc* especially for reboot mode.

```
#!/usr/bin/env bash

set -e

# time lapse
WAIT=${DARC_WAIT=10}

# signal handlers
trap '[ -f ${PATH_DATA}/darc.pid ] && kill -2 $(cat ${PATH_DATA}/darc.pid)' SIGINT
↪SIGTERM SIGKILL

# initialise
echo "+ Starting application..."
python3 -m darc $@
sleep ${WAIT}

# mainloop
while true; do
  echo "+ Restarting application..."
  python3 -m darc
  sleep ${WAIT}
done
```

In such scenario, you can customise your *run.sh* to, for instance, archive then upload current data crawled by *darc* to somewhere else and save up some disk space.

WEB BACKEND DEMO

This is a demo of API for communication between the `darc` crawlers (`darc.submit`) and web UI.

Assuming the web UI is developed using the `Flask` microframework.

```
# -*- coding: utf-8 -*-

import sys

import flask # pylint: disable=import-error

# Flask application
app = flask.Flask(__file__)

@app.route('/api/new_host', methods=['POST'])
def new_host():
    """When a new host is discovered, the :mod:`darc` crawler will submit the
    host information. Such includes ``robots.txt`` (if exists) and
    ``sitemap.xml`` (if any).

    Data format::

        {
            // partial flag - true / false
            "$PARTIAL$": ...,
            // metadata of URL
            "[metadata)": {
                // original URL - <scheme>://<netloc>/<path>;<params>?<query>#
            },
            "url": ...,
            // proxy type - null / tor / i2p / zeronet / freenet
            "proxy": ...,
            // hostname / netloc, c.f. ``urllib.parse.urlparse``
            "host": ...,
            // base folder, relative path (to data root path ``PATH_DATA``) in_
            "base": ...,
            // sha256 of URL as name for saved files (timestamp is in ISO format)
            // JSON log as this one - <base>/<name>_<timestamp>.json

CHAPTER
FOUR

DATA MODELS DEMO

This is a demo of data models for database storage of the submitted data from the *darc* crawlers.

Assuming the database is using `peewee` as ORM and `MySQL` as backend.

```
# -*- coding: utf-8 -*-

import datetime
import os

import peewee
import playhouse.shortcuts

# database client
DB = playhouse.db_url.connect(os.getenv('DB_URL', 'mysql://127.0.0.1'))

def table_function(model_class: peewee.Model) -> str:
    """Generate table name dynamically.

    The function strips ``Model`` from the class name and
    calls :func:`peewee.make_snake_case` to generate a
    proper table name.

    Args:
        model_class: Data model class.

    Returns:
        Generated table name.

    """
    name: str = model_class.__name__
    if name.endswith('Model'):
        name = name[:-5] # strip ``Model`` suffix
    return peewee.make_snake_case(name)

class BaseMeta:
    """Basic metadata for data models."""

    #: Reference database storage (c.f. :class:`~darc.const.DB`).
    database = DB

    #: Generate table name dynamically (c.f. :func:`~darc.model.table_function`).
    table_function = table_function
```

(continues on next page)

(continued from previous page)

```

class BaseModel(peewee.Model):
    """Base model with standard patterns.

    Notes:
        The model will implicitly have a :class:`~peewee.AutoField` attribute named as :attr:`id`.

    """

    #: Basic metadata for data models.
    Meta = BaseMeta

    def to_dict(self, keep_id: bool = False):
        """Convert record to :obj:`dict`.

        Args:
            keep_id: If keep the ID auto field.

        Returns:
            The data converted through :func:`playhouse.shortcuts.model_to_dict`.

        """
        data = playhouse.shortcuts.model_to_dict(self)
        if keep_id:
            return data

        if 'id' in data:
            del data['id']
        return data

class HostnameModel(BaseModel):
    """Data model for a hostname record."""

    #: Hostname (c.f. :attr:`link.host <darc.link.Link.host>`).

class HostsModel(BaseModel):
    """Data model for ``hosts.txt`` data."""

    #: Hostname (c.f. :attr:`link.host <darc.link.Link.host>`).
    host: HostnameModel = peewee.ForeignKeyField(HostnameModel, backref='hosts')
    #: Timestamp of the submission.
    timestamp: datetime.datetime = peewee.DateTimeField()

    #: Document data as :obj:`bytes`.
    data: bytes = peewee.BlobField()
    #: Path to the document.
    path: str = peewee.CharField()

class URLModel(BaseModel):
    """Data model for a requested URL."""

    #: Timestamp of last related submission.
    last_seen: datetime.datetime = peewee.DateTimeField()
    #: Original URL (c.f. :attr:`link.url <darc.link.Link.url>`).
    url: str = peewee.TextField()

    #: Hostname (c.f. :attr:`link.host <darc.link.Link.host>`).
    host: HostnameModel = peewee.ForeignKeyField(HostnameModel, backref='urls')
    #: Proxy type (c.f. :attr:`link.proxy <darc.link.Link.proxy>`).
    proxy: str = peewee.CharField(max_length=8)

    #: Base path (c.f. :attr:`link.base <darc.link.Link.base>`).
    base: str = peewee.CharField()
    #: Link hash (c.f. :attr:`link.name <darc.link.Link.name>`).
    name: str = peewee.FixedCharField(max_length=64)

class RequestsDocumentModel(BaseModel):
    """Data model for documents from ``requests`` submission."""

    #: Original URL (c.f. :attr:`link.url <darc.link.Link.url>`).
    url: URLModel = peewee.ForeignKeyField(URLModel, backref='requests')

```

(continues on next page)

(continued from previous page)

```
#: Document data as :obj:`bytes`.  
data: bytes = peewee.BlobField()  
#: Path to the document.  
path: str = peewee.CharField()  
  
class SeleniumDocumentModel(BaseModel):  
    """Data model for documents from ``selenium`` submission."  
  
    #: Original URL (c.f. :attr:`link.url <darc.link.Link.url>`).  
    url: URLModel = peewee.ForeignKeyField(URLModel, backref='selenium')  
  
    #: Document data as :obj:`bytes`.  
    data: bytes = peewee.BlobField()  
    #: Path to the document.  
    path: str = peewee.CharField()
```

AUXILIARY SCRIPTS

Since the `darc` project can be deployed through *Docker Integration*, we provided some auxiliary scripts to help with the deployment.

5.1 Health Check

File location

- Entry point: `extra/healthcheck.py`
- System V service: `extra/healthcheck.service`

```
usage: healthcheck [-h] [-f FILE] [-i INTERVAL] ...

health check running container

positional arguments:
  services           name of services

optional arguments:
  -h, --help          show this help message and exit
  -f FILE, --file FILE path to compose file
  -i INTERVAL, --interval INTERVAL
                      interval (in seconds) of health check
```

This script will watch the running status of containers managed by Docker Compose. If the containers are stopped or of *unhealthy* status, it will bring the containers back alive.

Also, as the internal program may halt unexpectedly whilst the container remains *healthy*, the script will watch if the program is still active through its output messages. If inactive, the script will restart the containers.

5.2 Upload API Submission Files

File location

- Entry point: `extra/upload.py`
- Helper script: `extra/upload.sh`
- System V service: `extra/upload.service`

```
usage: upload [-h] [-f FILE] [-p PATH] [-i INTERVAL] -H HOST [-U USER]

upload API submission files

optional arguments:
  -h, --help            show this help message and exit
  -f FILE, --file FILE  path to compose file
  -p PATH, --path PATH  path to data storage
  -i INTERVAL, --interval INTERVAL
                        interval (in seconds) to upload
  -H HOST, --host HOST  upstream hostname
  -U USER, --user USER  upstream user credential
```

This script will automatically upload API submission files, c.f. `darc.submit`, using `curl(1)`. The `--user` option is supplied for the same option of `curl(1)`.

When uploading, the script will *pause* the running containers and it will *unpause* them upon completion.

5.3 Remove Repeated Lines

File location `extra/uniq.py`

This script works the same as `uniq(1)`, except it filters one input line at a time without putting pressure onto memory utilisation.

`darc` is designed as a swiss army knife for darkweb crawling. It integrates `requests` to collect HTTP request and response information, such as cookies, header fields, etc. It also bundles `selenium` to provide a fully rendered web page and screenshot of such view.

There are two types of *workers*:

- `crawler` – runs the `darc.crawl.crawler()` to provide a fresh view of a link and test its connectability
- `loader` – run the `darc.crawl.loader()` to provide an in-depth view of a link and provide more visual information

The general process can be described as following for *workers* of `crawler` type:

1. `process_crawler()`: obtain URLs from the `requests` link database (c.f. `load_requests()`), and feed such URLs to `crawler()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `crawler()`: parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, `darc` will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`). Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, `darc` will check if allowed to crawl the URL.

Note: The root path (e.g. / in <https://www.example.com/>) will always be crawled ignoring robots.txt.

At this point, `darc` will call the customised hook function from `darc.sites` to crawl and get the final response object. `darc` will save the session cookies and header information, using `save_headers()`.

Note: If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped.

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If NOT, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for `workers` of `loader` type:

1. `process_loader()`: in the meanwhile, `darc` will obtain URLs from the selenium link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

Note: If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original WebDriver object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

CHAPTER
SIX

INSTALLATION

Note: `darc` supports Python all versions above and includes **3.6**. Currently, it only supports and is tested on Linux (*Ubuntu 18.04*) and macOS (*Catalina*).

When installing in Python versions below **3.8**, `darc` will use `walrus` to compile itself for backport compatibility.

```
pip install darc
```

Please make sure you have Google Chrome and corresponding version of Chrome Driver installed on your system.

Important: Starting from version **0.3.0**, we introduced `Redis` for the task queue database backend. Please make sure you have it installed, configured, and running when using the `darc` project.

However, the `darc` project is shipped with Docker and Compose support. Please see *Docker Integration* for more information.

Or, you may refer to and/or install from the [Docker Hub](#) repository:

```
docker pull jsnbzh/darc[:TAGNAME]
```

CHAPTER
SEVEN

USAGE

The *darc* project provides a simple CLI:

```
usage: darc [-h] [-f FILE] ...

the darkweb crawling swiss army knife

positional arguments:
  link           links to craw

optional arguments:
  -h, --help      show this help message and exit
  -f FILE, --file FILE  read links from file
```

It can also be called through module entrypoint:

```
python -m python-darc ...
```

Note: The link files can contain **comment** lines, which should start with `#`. Empty lines and comment lines will be ignored when loading.

CONFIGURATION

Though simple CLI, the `darc` project is more configurable by environment variables.

8.1 General Configurations

DARC_REBOOT

Type `bool(int)`

Default 0

If exit the program after first round, i.e. crawled all links from the `requests` link database and loaded all links from the `selenium` link database.

This can be useful especially when the capacity is limited and you wish to save some space before continuing next round. See [Docker integration](#) for more information.

DARC_DEBUG

Type `bool(int)`

Default 0

If run the program in debugging mode.

DARC_VERBOSE

Type `bool(int)`

Default 0

If run the program in verbose mode. If DARC_DEBUG is `True`, then the verbose mode will be always enabled.

DARC_FORCE

Type `bool(int)`

Default 0

If ignore `robots.txt` rules when crawling (c.f. `crawler()`).

DARC_CHECK

Type `bool(int)`

Default 0

If check proxy and hostname before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

If DARC_CHECK_CONTENT_TYPE is `True`, then this environment variable will be always set as `True`.

DARC_CHECK_CONTENT_TYPE

Type `bool(int)`

Default 0

If check content type through HEAD requests before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

DARC_CPU

Type `int`

Default `None`

Number of concurrent processes. If not provided, then the number of system CPUs will be used.

DARC_MULTIPROCESSING

Type `bool(int)`

Default 1

If enable *multiprocessing* support.

DARC_MULTITHREADING

Type `bool(int)`

Default 0

If enable *multithreading* support.

Note: DARC_MULTIPROCESSING and DARC_MULTITHREADING can **NOT** be toggled at the same time.

DARC_USER

Type `str`

Default current login user (c.f. `getpass.getuser()`)

Non-root user for proxies.

8.2 Data Storage

See also:

See `darc.save` for more information about source saving.

See `darc.db` for more information about Redis database integration.

PATH_DATA

Type `str(path)`

Default `data`

Path to data storage.

REDIS_URL

Type `str(url)`

Default `redis://127.0.0.1`

URL to the Redis database.

DARC_BULK_SIZE

Type `int`

Default 100

Bulk size for updating Redis databases.

See also:

- `darc.db.save_requests()`
- `darc.db.save_selenium()`

LOCK_TIMEOUT

Type `float`

Default 10

Lock blocking timeout.

Note: If is an infinit `inf`, no timeout will be applied.

See also:

Get a lock from `darc.db.get_lock()`.

DARC_MAX_POOL

Type `int`

Default 1_000

Maximum number of links loaded from the database.

Note: If is an infinit `inf`, no limit will be applied.

See also:

- `darc.db.load_requests()`
- `darc.db.load_selenium()`

darc.db.REDIS_LOCK

Type `bool(int)`

Default 0

If use Redis (Lua) lock to ensure process/thread-safely operations.

See also:

Toggles the behaviour of `darc.db.get_lock()`.

REDIS_RETRY

Type `int`

Default 10

Retry interval between each Redis command failure.

Note: If is an infinit `inf`, no interval will be applied.

See also:

Toggles the behaviour of `darc.db.redis_command()`.

8.3 Web Crawlers

DARC_WAIT

Type `float`

Default 60

Time interval between each round when the `requests` and/or selenium database are empty.

DARC_SAVE

Type `bool(int)`

Default 0

If save processed link back to database.

Note: If `DARC_SAVE` is `True`, then `DARC_SAVE_REQUESTS` and `DARC_SAVE_SELENIUM` will be forced to be `True`.

See also:

See `darc.db` for more information about link database.

DARC_SAVE_REQUESTS

Type `bool(int)`

Default 0

If save `crawler()` crawled link back to `requests` database.

See also:

See `darc.db` for more information about link database.

DARC_SAVE_SELENIUM

Type `bool(int)`

Default 0

If save `loader()` crawled link back to selenium database.

See also:

See `darc.db` for more information about link database.

TIME_CACHE

Type `float`

Default 60

Time delta for caches in seconds.

The `darc` project supports *caching* for fetched files. `TIME_CACHE` will specify for how long the fetched files will be cached and **NOT** fetched again.

Note: If `TIME_CACHE` is `None` then caching will be marked as *forever*.

SE_WAIT

Type float

Default 60

Time to wait for selenium to finish loading pages.

Note: Internally, selenium will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

8.4 White / Black Lists

LINK_WHITE_LIST

Type List[str] (JSON)

Default []

White list of hostnames should be crawled.

Note: Regular expressions are supported.

LINK_BLACK_LIST

Type List[str] (JSON)

Default []

Black list of hostnames should be crawled.

Note: Regular expressions are supported.

LINK_FALLBACK

Type bool(int)

Default 0

Fallback value for `match_host()`.

MIME_WHITE_LIST

Type List[str] (JSON)

Default []

White list of content types should be crawled.

Note: Regular expressions are supported.

MIME_BLACK_LIST

Type List[str] (JSON)

Default []

Black list of content types should be crawled.

Note: Regular expressions are supported.

MIME_FALLBACK

Type bool(int)

Default 0

Fallback value for `match_mime()`.

PROXY_WHITE_LIST

Type List[str] (JSON)

Default []

White list of proxy types should be crawled.

Note: The proxy types are **case insensitive**.

PROXY_BLACK_LIST

Type List[str] (JSON)

Default []

Black list of proxy types should be crawled.

Note: The proxy types are **case insensitive**.

PROXY_FALLBACK

Type bool(int)

Default 0

Fallback value for `match_proxy()`.

Note: If provided, LINK_WHITE_LIST, LINK_BLACK_LIST, MIME_WHITE_LIST, MIME_BLACK_LIST, PROXY_WHITE_LIST and PROXY_BLACK_LIST should all be JSON encoded strings.

8.5 Data Submission

API_RETRY

Type `int`

Default 3

Retry times for API submission when failure.

API_NEW_HOST

Type `str`

Default `None`

API URL for `submit_new_host()`.

API_REQUESTS

Type `str`

Default `None`

API URL for `submit_requests()`.

API_SELENIUM

Type `str`

Default `None`

API URL for `submit_selenium()`.

Note: If `API_NEW_HOST`, `API_REQUESTS` and `API_SELENIUM` is `None`, the corresponding submit function will save the JSON data in the path specified by `PATH_DATA`.

8.6 Tor Proxy Configuration

DARC_TOR

Type `bool(int)`

Default 1

If manage the Tor proxy through `darc`.

TOR_PORT

Type `int`

Default 9050

Port for Tor proxy connection.

TOR_CTRL

Type `int`

Default 9051

Port for Tor controller connection.

TOR_PASS

Type `str`

Default `None`

Tor controller authentication token.

Note: If not provided, it will be requested at runtime.

TOR_RETRY

Type `int`

Default `3`

Retry times for Tor bootstrap when failure.

TOR_WAIT

Type `float`

Default `90`

Time after which the attempt to start Tor is aborted.

Note: If not provided, there will be **NO** timeouts.

TOR_CFG

Type `Dict[str, Any]` (JSON)

Default `{}`

Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

Note: If provided, it should be a JSON encoded string.

8.7 I2P Proxy Configuration

DARC_I2P

Type `bool(int)`

Default `1`

If manage the I2P proxy through `darc`.

I2P_PORT

Type `int`

Default `4444`

Port for I2P proxy connection.

I2P_RETRY

Type `int`

Default `3`

Retry times for I2P bootstrap when failure.

I2P_WAIT

Type float

Default 90

Time after which the attempt to start I2P is aborted.

Note: If not provided, there will be **NO** timeouts.

I2P_ARGS

Type str (Shell)

Default ''

I2P bootstrap arguments for `i2prouter start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

Note: The command will be run as DARC_USER, if current user (c.f. `getpass.getuser()`) is *root*.

8.8 ZeroNet Proxy Configuration

DARC_ZERONET

Type bool (int)

Default 1

If manage the ZeroNet proxy through `darc`.

ZERONET_PORT

Type int

Default 4444

Port for ZeroNet proxy connection.

ZERONET_RETRY

Type int

Default 3

Retry times for ZeroNet bootstrap when failure.

ZERONET_WAIT

Type float

Default 90

Time after which the attempt to start ZeroNet is aborted.

Note: If not provided, there will be **NO** timeouts.

ZERONET_PATH

Type `str`(path)

Default /usr/local/src/zeronet

Path to the ZeroNet project.

ZERONET_ARGS

Type `str`(Shell)

Default ''

ZeroNet bootstrap arguments for `ZeroNet.sh main`.

Note: If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

8.9 Freenet Proxy Configuration

DARC_FREENET

Type `bool(int)`

Default 1

If manage the Freenet proxy through `darc`.

FREENET_PORT

Type `int`

Default 8888

Port for Freenet proxy connection.

FREENET_RETRY

Type `int`

Default 3

Retry times for Freenet bootstrap when failure.

FREENET_WAIT

Type `float`

Default 90

Time after which the attempt to start Freenet is aborted.

Note: If not provided, there will be **NO** timeouts.

FREENET_PATH

Type `str`(path)

Default /usr/local/src/freenet

Path to the Freenet project.

FREENET_ARGS

Type `str` (Shell)

Default ''

Freenet bootstrap arguments for `run.sh start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

Note: The command will be run as DARC_USER, if current user (c.f. `getpass.getuser()`) is *root*.
