*darc* is designed as a swiss army knife for darkweb crawling. It integrates *requests* to collect HTTP request and response information, such as cookies, header fields, etc. It also bundles *selenium* to provide a fully rendered web page and screenshot of such view.

## HOW TO ...

This is the knowledge base for *darc* project. Should you request for more articles, please create an issue at the [GitHub repository](#).

### 1.1 How to gracefully deploy *darc*?

---

**Important:** It is **NOT** necessary to work at the *darc* repository folder directly. You can just use *darc* with your customised code somewhere as you wish.

However, for simplicity, all relative paths referred in this article is relative to the project root of the *darc* repository.

---

To deploy *darc*, there would generally be three basic steps:

1. deploy the *darc* Docker image;
2. setup the healthcheck watchdog service;
3. install the upload cron job (optional)

#### 1.1.1 To Start With

Per best practice, the system must have as least **2 GB RAM** and **2 CPU cores** to handle the *loader* worker properly. And the capacity of the RAM will heavily impact the performance of the *selenium* integration as Google Chrome is the renowned memory monster.

---

**Note:** Imma assume that you're using \*NIX systems, as I don't believe a Windows user is gonna see this ;)

---

Firstly, you will need to clone the repository to your system:

```
git clone https://github.com/JarryShaw/darc.git
# change your working directory
cd darc
```

then set up the folders you need for the log files:

```
mkdir -p logs
mkdir -p logs/cron
```

And now, you will need to decide where you would like to store the data (documents crawled and saved by `darc`); let's assume that you have a `/data` disk mounted on the system – since that's what I have on mine xD – which would be big enough to use as a safe separated storage place from the system so that `darc` will not crash your system by exhausting the storage,

```
mkdir /data/darc
# and make a shortcut
ln -s /data/darc data
```

therefore, you're gonna save your data in `/data/darc` folder.

### 1.1.2 Software Dependency

After setting local systems, there're some software dependencies you shall install:

#### 1. Docker

`darc` is exclusively deployed through Docker environment, even though it can also be deployed directly on a host machine, either Linux or macOS, and perhaps Windows but I had never tested.

#### 2. Database

`darc` needs database backend for the task queue management and other stuffs. It is highly recommended to deploy `darc` with [Redis](#); but if you insist, you may use relationship database (e.g. [MySQL](#), [SQLite](#), [PostgreSQL](#), etc.) instead.

---

**Important:** In this article, I will not discuss about the usage of relationship database as they're just too miserable for `darc` in terms of availability anyway.

---

As per best practice, *4 GB RAM* would be minimal requirement for the Redis database. It would be suggested to use directly a cloud provider hosted Redis database instead of running it on the same server as `darc`.

### 1.1.3 Deploy `darc` Docker Image

As discussed in [Docker Integration](#), `darc` is exclusively integrated with Docker workflow. So basically, just pull the image from Docker Hub or GitHub Container Registry:

```
# Docker Hub
docker pull jsnbzh/darc:latest
# GitHub Container Registry
docker pull ghcr.io/jarryshaw/darc:latest
```

In cases where you would like to use a *debug* image, which changes the `apt` sources to China hosted and IPython and other auxiliaries installed, you call also pull such image instead:

```
# Docker Hub
docker pull jsnbzh/darc:debug
# GitHub Container Registry
docker pull ghcr.io/jarryshaw/darc-debug:latest
```

Then you will need to customise the `docker-compose.yml` based on your needs. Default values and descriptive help messages can be found in the file.

The rest of it is easy as just calling `docker-compose` command to manage the deployed containers, thus I shall not discuss further.

## Deploy with Customisations

**Important:** I've made a sample customisation at `demo/deploy/` folder, which can be used directly as a new repository to start with your customisation, please check it out before moving forwards.

As in the sample customisation, you can simply use the `Dockerfile` there as your Docker environment declaration. And the entrypoint file `market/run.py` has the sites customisations registered and the CLI bundled.

### 1.1.4 Setup healthcheck Daemon Service

Since `darc` can be quite a burden to its host system, I introduced this healthcheck service as discussed in *Auxiliary Scripts*.

For a normal **System V** based service system, you can simply install the `darc-healthcheck` service to `/etc/systemd/system/`:

```
ln -s extra/healthcheck.service /etc/systemd/system/darc-healthcheck.service
```

then enable it to run at startup:

```
sudo systemctl enable darc-healthcheck.service
```

And from now on, you can simply manage the `darc-healthcheck` service through `systemctl` or `service` command as you prefer.

### 1.1.5 Install upload Cron Job

In certain cases, you might wish to upload the API submission JSON files to your FTP server which has much more space than the deploy server, then you can utilise the `upload` cron job as mentioned in *Auxiliary Scripts*.

Simply type the following command:

```
crontab -e
```

and add the cron job into the file opened:

just remember to change the paths, hostname and credential respectively; and at last, to activate the new cron job:

```
sudo systemctl restart cron.service
```

Now, `darc` API submission JSON files will be uploaded to the target FTP server everyday at *0:10 am*.

### 1.1.6 Bonus Tip

There is a `Makefile` at the project root. You can play and try to exploit it. A very useful command is that

```
make reload
```

when you wish to pull the remote repository and restart `darc` gracefully.

## 1.2 How to implement a sites customisation?

As had been discussed already in the [documentation](#), the implementation of a sites customisation is dead simple: just inherits the `darc.sites.BaseSite` class and overwrites the corresponding `crawler()` and `loader()` **abstract static methods**.

See below an example from the documentation.

```
from darc.sites import BaseSite, register
```

As the class below suggests, you may implement and register your sites customisation for `mysite.com` and `www.mysite.com` using the `MySite` class, where `hostname` attribute contains the list of hostnames to which the class should be associated with.

**NB:** Implementation details of the `crawler` and `loader` methods will be discussed in following sections.

```
class MySite(BaseSite):
    """This is a site customisation class for demonstration purpose.
    You may implement a module as well should you prefer."""

    #: List[str]: Hostnames the sites customisation is designed for.
    hostname = ['mysite.com', 'www.mysite.com']

    @staticmethod
    def crawler(session, link): ...

    @staticmethod
    def loader(driver, link): ...
```

Should your sites customisation be associated with multiple sites, you can just add them all to the `hostname` attribute; when you call `darc.sites.register()` to register your sites customisation, the function will automatically handle the registry association information.

```
# register sites implicitly
register(MySite)
```

Nonetheless, in case where you would rather specify the hostnames at runtime (instead of adding them to the `hostname` attribute), you may just leave out the `hostname` attribute as `None` and specify your list of hostnames at `darc.sites.register()` function call.

```
# register sites explicitly
register(MySite, 'mysite.com', 'www.mysite.com')
```

### 1.2.1 Crawler Hook

The `crawler` method is based on `requests.Session` objects and returns a `requests.Response` instance representing the *crawled* web page.

Type annotations of the method can be described as

```
@staticmethod
def crawler(session: requests.Session, link: darc.link.Link) -> requests.Response: ...
```

where `session` is the `requests.Session` instance with **proxy** presets and `link` is the target link (parsed by `darc.link.parse_link()` to provide more information than mere string).

For example, let's say you would like to inject a cookie named `SessionID` and an `Authentication` header with some fake identity, then you may write the `crawler` method as below.

```
@staticmethod
def crawler(session, link):
    """Crawler hook for my site.

    Args:
        session (requests.Session): Session object with proxy settings.
        link (darc.link.Link): Link object to be crawled.

    Returns:
        requests.Response: The final response object with crawled data.

    """
    # inject cookies
    session.cookies.set('SessionID', 'fake-session-id-value')

    # insert headers
    session.headers['Authentication'] = 'Basic fake-identity-credential'

    response = session.get(link.url, allow_redirects=True)
    return response
```

In this case when `darc` crawling the link, the HTTP(S) request will be provided with a session cookie and HTTP header, so that it may bypass potential authorisation checks and land on the target page.

## 1.2.2 Loader Hook

The loader method is based on `selenium.webdriver.Chrome` objects and returns a the original web driver instance containing the *loaded* web page.

Type annotations of the method can be described as

```
@staticmethod
def loader(driver: selenium.webdriver.Chrome, link: darc.link.Link) -> selenium.
    webdriver.Chrome: ...
```

where `driver` is the `selenium.webdriver.Chrome` instance with **proxy** presets and `link` is the target link (parsed by `darc.link.parse_link()` to provide more information than mere string).

For example, let's say you would like to animate user login and go to the target page after successful attempt, then you may write the loader method as below.

```
@staticmethod
def loader(driver, link):
    """Loader hook for my site.

    Args:
        driver (selenium.webdriver.Chrome): Web driver object with proxy settings.
        link (darc.link.Link): Link object to be loaded.

    Returns:
        selenium.webdriver.Chrome: The web driver object with loaded data.

    """
    # land on login page
```

(continues on next page)

(continued from previous page)

```

driver.get('https://%s/login' % link.host)

# animate login attempt
form = driver.find_element_by_id('login-form')
form.find_element_by_id('username').send_keys('admin')
form.find_element_by_id('password').send_keys('p@ssd')
form.click()

# check if the attempt succeeded
if driver.title == 'Please login!':
    raise ValueError('failed to login %s' % link.host)

# go to the target page
driver.get(link.url)

# wait for page to finish loading
from darc.const import SE_WAIT # should've been put with the top-level import_
↪ statements
if SE_WAIT is not None:
    time.sleep(SE_WAIT)

return driver

```

In this case when *darc* loading the link, the web driver will first perform user login, so that it may bypass potential authorisation checks and land on the target page.

### 1.2.3 In case to drop the link from task queue...

In some scenarios, you may want to remove the target link from the task queue, then there're basically two ways:

1. do like a wildling, remove it directly from the database

As there're three task queues used in *darc*, each represents task queues for the *crawler* (*requests* database) and *loader* (*selenium* database) worker nodes and a track record for known hostnames (*hostname* database), you will need to call corresponding functions to remove the target link from the database desired.

Possible functions are as below:

- *darc.db.drop\_hostname()*
- *darc.db.drop\_requests()*
- *darc.db.drop\_selenium()*

all take one positional argument *link*, i.e. the *darc.link.Link* object to be removed.

Say you would like to remove `https://www.mysite.com` from the *requests* database, then you may just run

```

from darc.db import drop_requests
from darc.link import parse_link

link = parse_link('https://www.mysite.com')
drop_requests(link)

```

2. or make it in an elegant way

When implementing the sites customisation, you may wish to drop certain links at runtime, then you may simply raise *darc.error.LinkNoReturn* in the corresponding crawler and/or loader methods.

For instance, you would like to proceed with `mysite.com` but **NOT** `www.mysite.com` in the sites customisation, then you may implement your class as

```
from darc.error import LinkNoReturn

class MySite(BaseSite):

    ...

    @staticmethod
    def crawler(session, link):
        if link.host == 'www.mysite.com':
            raise LinkNoReturn(link)

        ...

    @staticmethod
    def loader(driver, link):
        if link.host == 'www.mysite.com':
            raise LinkNoReturn(link)

        ...
```

## 1.2.4 Then what should I do to include my sites customisation?

Simple as well!

Just *install* your codes to where you're running *darc*, e.g. the Docker container, remote server, etc.; then change the startup by injecting your codes before the entrypoint.

Say the structure of the working directory is as below:

```
.
|-- .venv/
|   |-- lib/python3.8/site-packages
|   |   |-- darc/
|   |   |   |-- ...
|   |   |-- ...
|   |-- ...
|-- mysite.py
|-- ...
```

where `.venv` is the folder of virtual environment with *darc* installed and `mysite.py` is the file with your sites customisation.

Then you just need to change your `mysite.py` with some additional lines as below:

```
# mysite.py

import sys

from darc.__main__ import main
from darc.sites import BaseSite, register

class MySite(BaseSite):
```

(continues on next page)

(continued from previous page)

```
...

# register sites
register(MySite)

if __name__ == '__main__':
    sys.exit(main())
```

And now, you can start *darc* through `python mysite.py [...]` instead of `python -m darc [...]` with your sites customisation registered to the system.

**See also:**

`mysite.py`

## 1.3 How to implement a custom proxy middleware?

As had been discussed already in the [documentation](#), the implementation of a custom proxy is merely two *factory* functions: one yields a `requests.Session` and/or `requests_futures.sessions.FuturesSession` instance, one yields a `selenium.webdriver.Chrome` instance; both with proxy presets.

See below an example from the documentation.

```
from darc.proxy import register
```

### 1.3.1 Session Factory

The session factory returns a `requests.Session` and/or `requests_futures.sessions.FuturesSession` instance with presets, e.g. proxies, user agent, etc.

Type annotation of the function can be described as

```
def get_session(futures=False) -> requests.Session: ...

@typing.overload
def get_session(futures=True) -> requests_futures.sessions.FuturesSession: ...
```

For example, let's say you're implementing a Socks5 proxy for *localhost:9293*, with other presets same as the default factory function, c.f. `darc.requests.null_session()`.

```
import requests
import requests_futures.sessions

from darc.const import DARC_CPU
from darc.requests import default_user_agent

def socks5_session(futures=False):
    """Socks5 proxy session.

    Args:
        futures: If returns a :class:`requests_futures.FuturesSession`.
```

(continues on next page)

(continued from previous page)

```

Returns:
    Union[requests.Session, requests_futures.FuturesSession]:
    The session object with Socks5 proxy settings.

"""
if futures:
    session = requests_futures.sessions.FuturesSession(max_workers=DARC_CPU)
else:
    session = requests.Session()

session.headers['User-Agent'] = default_user_agent(proxy='Socks5')
session.proxies.update(dict(
    http='socks5h://localhost:9293',
    https='socks5h://localhost:9293',
))
return session

```

In this case when *darc* needs to use a Socks5 session for its *crawler* worker nodes, it will call the `socks5_session` function to obtain a preset session instance.

## 1.3.2 Driver Factory

The driver factory returns a `selenium.webdriver.Chrome` instance with presets, e.g. proxies, options/switches, etc.

Type annotation of the function can be described as

```
def get_driver() -> selenium.webdriver.Chrome: ...
```

For example, let's say you're implementing a Socks5 proxy for `localhost:9293`, with other presets same as the default factory function, c.f. `darc.selenium.null_driver()`.

```

import selenium.webdriver
import selenium.webdriver.common.proxy

from darc.selenium import BINARY_LOCATION

def socks5_driver():
    """Socks5 proxy driver.

    Returns:
        selenium.webdriver.Chrome: The web driver object with Socks5 proxy settings.

    """
    options = selenium.webdriver.ChromeOptions()
    options.binary_location = BINARY_LOCATION
    options.add_argument('--proxy-server=socks5://localhost:9293')
    options.add_argument('--host-resolver-rules="MAP * ~NOTFOUND , EXCLUDE localhost"
→ ')

    proxy = selenium.webdriver.Proxy()
    proxy.proxyType = selenium.webdriver.common.proxy.ProxyType.MANUAL
    proxy.http_proxy = 'socks5://localhost:9293'
    proxy.ssl_proxy = 'socks5://localhost:9293'

```

(continues on next page)

(continued from previous page)

```
capabilities = selenium.webdriver.DesiredCapabilities.CHROME.copy()
proxy.add_to_capabilities(capabilities)

driver = selenium.webdriver.Chrome(options=options,
                                   desired_capabilities=capabilities)

return driver
```

In this case when *darc* needs to use a Socks5 driver for its *loader* worker nodes, it will call the `socks5_driver` function to obtain a preset driver instance.

### 1.3.3 What should I do to register the proxy?

All proxies are managed in the `darc.proxy` module and you can register your own proxy through `darc.proxy.register()`:

```
# register proxy
register('socks5', socks5_session, socks5_driver)
```

As the codes above suggest, the `darc.proxy.register()` takes three positional arguments: proxy type, session and driver factory functions.

**See also:**

`socks5.py`

## TECHNICAL DOCUMENTATION

`darc` is designed as a swiss army knife for darkweb crawling. It integrates `requests` to collect HTTP request and response information, such as cookies, header fields, etc. It also bundles `selenium` to provide a fully rendered web page and screenshot of such view.

### 2.1 Main Processing

The `darc.process` module contains the main processing logic of the `darc` module.

`darc.process._process(worker)`

Wrapper function to start the worker process.

**Parameters** `worker` (`Union[darc.process.process_crawler, darc.process.process_loader]`) –

**Return type** `None`

`darc.process._signal_handler(signum=None, frame=None)`

Signal handler.

If the current process is not the main process, the function shall do nothing.

**Parameters**

- **signum** (`Optional[Union[int, signal.Signals]]`) – The signal to handle.
- **frame** (`types.FrameType`) – The traceback frame from the signal.

**Return type** `None`

**See also:**

- `darc.const.getpid()`

`darc.process.process(worker)`

Main process.

The function will register `_signal_handler()` for SIGTERM, and start the main process of the `darc` darkweb crawlers.

**Parameters** `worker` (`Literal[crawler, loader]`) – Worker process type.

**Raises** `ValueError` – If `worker` is not a valid value.

**Return type** `None`

Before starting the workers, the function will start proxies through

- `darc.proxy.tor.tor_proxy()`
- `darc.proxy.i2p.i2p_proxy()`
- `darc.proxy.zeronet.zeronet_proxy()`
- `darc.proxy.freenet.freenet_proxy()`

The general process can be described as following for *workers* of crawler type:

1. `process_crawler()`: obtain URLs from the `requests` link database (c.f. `load_requests()`), and feed such URLs to `crawler()`.

---

**Note:** If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

---

2. `crawler()`: parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, *darc* will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`). Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, *darc* will check if allowed to crawl the URL.

---

**Note:** The root path (e.g. `/` in `https://www.example.com/`) will always be crawled ignoring `robots.txt`.

---

At this point, *darc* will call the customised hook function from `darc.sites` to crawl and get the final response object. *darc* will save the session cookies and header information, using `save_headers()`.

---

**Note:** If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped.

---

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If **NOT**, the URL will be saved into `selenium` link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for *workers* of loader type:

1. `process_loader()`: in the meanwhile, *darc* will obtain URLs from the `selenium` link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

---

**Note:** If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in

single-threading.

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original Chrome object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

After each *round*, `darc` will call registered hook functions in sequential order, with the type of worker ('crawler' or 'loader') and the current link pool as its parameters, see `register()` for more information.

If in reboot mode, i.e. `REBOOT` is `True`, the function will exit after first round. If not, it will renew the Tor connections (if bootstrapped), c.f. `renew_tor_session()`, and start another round.

`darc.process.process_crawler()`

A worker to run the `crawler()` process.

**Warns** `HookExecutionFailed` – When hook function raises an error.

**Return type** `None`

`darc.process.process_loader()`

A worker to run the `loader()` process.

**Warns** `HookExecutionFailed` – When hook function raises an error.

**Return type** `None`

`darc.process.register(hook, *, _index=None)`

Register hook function.

**Parameters**

- **hook** (`Callable[[Literal[crawler, loader], List[darc.link.Link]], None]`) – Hook function to be registered.
- **\_index** (`Optional[int]`) –

**Keyword Arguments** `_index` – Position index for the hook function.

**Return type** `None`

The hook function takes two parameters:

1. a `str` object indicating the type of worker, i.e. 'crawler' or 'loader';
2. a `list` object containing `Link` objects, as the current processed link pool.

The hook function may raises `WorkerBreak` so that the worker shall break from its indefinite loop upon finishing of current *round*. Any value returned from the hook function will be ignored by the workers.

**See also:**

The hook functions will be saved into `_HOOK_REGISTRY`.

`darc.process._HOOK_REGISTRY`: `typing.List[typing.Callable[[typing.Literal[crawler, loader],`  
List of hook functions to be called between each *round*.

**Type** `List[Callable[[Literal['crawler', 'loader'], List[Link]]]`

`darc.process._WORKER_POOL` = `None`  
List of active child processes and/or threads.

**Type** `List[Union[multiprocessing.Process, threading.Thread]]`

## 2.2 Web Crawlers

The `darc.crawl` module provides two types of crawlers.

- `crawler()` – crawler powered by `requests`
- `loader()` – crawler powered by `selenium`

`darc.crawl.crawler(link)`

Single `requests` crawler for a entry link.

**Parameters** `link` (`darc.link.Link`) – URL to be crawled by `requests`.

**Return type** `None`

The function will first parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, `darc` will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`).

---

**Note:** A host is new if `have_hostname()` returns `True`.

If `darc.proxy.null.fetch_sitemap()` and/or `darc.proxy.i2p.fetch_hosts()` failed when fetching such documents, the host will be removed from the hostname database through `drop_hostname()`, and considered as new when next encounter.

---

Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, `darc` will check if allowed to crawl the URL.

---

**Note:** The root path (e.g. `/` in `https://www.example.com/`) will always be crawled ignoring `robots.txt`.

---

At this point, `darc` will call the customised hook function from `darc.sites` to crawl and get the final response object. `darc` will save the session cookies and header information, using `save_headers()`.

---

**Note:** If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped, and the link will be removed from the `requests` database through `drop_requests()`.

If `LinkNoReturn` is raised, the link will be removed from the `requests` database through `drop_requests()`.

---

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (text/html and application/xhtml+xml), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If **NOT**, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

`darc.crawl.loader(link)`

Single selenium loader for a entry link.

#### Parameters

- **Link** – URL to be crawled by selenium.
- **link** (`darc.link.Link`) –

#### Return type `None`

The function will first parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, `darc` will call the customised hook function from `darc.sites` to load and return the original `selenium.webdriver.Chrome` object.

---

**Note:** If `LinkNoReturn` is raised, the link will be removed from the selenium database through `drop_selenium()`.

---

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

---

**Note:** When taking full-page screenshot, `loader()` will use `document.body.scrollHeight` to get the total height of web page. If the page height is *less than 1,000 pixels*, then `darc` will by default set the height as **1,000 pixels**.

Later `darc` will tell selenium to resize the window (in *headless* mode) to **1,024 pixels** in width and **110%** of the page height in height, and take a *PNG* screenshot.

---

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

- `darc.const.SE_WAIT`

## 2.3 URL Utilities

The `Link` class is the key data structure of the `darc` project, it contains all information required to identify a URL's proxy type, hostname, path prefix when saving, etc.

The `link` module also provides several wrapper function to the `urllib.parse` module.

```
class darc.link.Link(url, proxy, url_parse, host, base, name)
```

Bases: `object`

Parsed link.

### Parameters

- **url** – original link
- **proxy** – proxy type
- **host** – URL's hostname
- **base** – base folder for saving files
- **name** – hashed link for saving files
- **url\_parse** – parsed URL from `urllib.parse.urlparse()`

**Returns** Parsed link object.

**Return type** `Link`

---

**Note:** `Link` is a `dataclass` object. It is safely *hashable*, through `hash(url)`.

---

```
__hash__()
```

Provide hash support to the `Link` object.

**Return type** `int`

```
base: str
```

base folder for saving files

```
host: str
```

URL's hostname

```
name: str
```

hashed link for saving files

```
proxy: str
```

proxy type

```
url: str
```

original link

```
url_parse: urllib.parse.ParseResult
```

parsed URL from `urllib.parse.urlparse()`

```
darc.link.parse_link(link, host=None)
```

Parse link.

### Parameters

- **link** (`str`) – link to be parsed
- **host** (`Optional[str]`) – hostname of the link

**Returns** The parsed link object.

**Return type** *darc.link.Link*

---

**Note:** If `host` is provided, it will override the hostname of the original link.

---

The parsing process of proxy type is as follows:

0. If `host` is `None` and the parse result from `urllib.parse.urlparse()` has no `netloc` (or host-name) specified, then set `hostname` as `(null)`; else set it as is.
1. If the scheme is `data`, then the link is a data URI, set `hostname` as `data` and `proxy` as `data`.
2. If the scheme is `javascript`, then the link is some JavaScript codes, set `proxy` as `script`.
3. If the scheme is `bitcoin`, then the link is a Bitcoin address, set `proxy` as `bitcoin`.
4. If the scheme is `ed2k`, then the link is an ED2K magnet link, set `proxy` as `ed2k`.
5. If the scheme is `magnet`, then the link is a magnet link, set `proxy` as `magnet`.
6. If the scheme is `mailto`, then the link is an email address, set `proxy` as `mail`.
7. If the scheme is `irc`, then the link is an IRC link, set `proxy` as `irc`.
8. If the scheme is **NOT** any of `http` or `https`, then set `proxy` to the scheme.
9. If the host is `None`, set `hostname` to `(null)`, set `proxy` to `null`.
10. If the host is an onion (`.onion`) address, set `proxy` to `tor`.
11. If the host is an I2P (`.i2p`) address, or any of `localhost:7657` and `localhost:7658`, set `proxy` to `i2p`.
12. If the host is `localhost` on `ZERONET_PORT`, and the path is not `/`, i.e. **NOT** root path, set `proxy` to `zeronet`; and set the first part of its path as `hostname`.

Example:

For a ZeroNet address, e.g. `http://127.0.0.1:43110/1HeLLo4uzjaLetFx6NH3PMwFP3qbRbTf3D`, `parse_link()` will parse the hostname as `1HeLLo4uzjaLetFx6NH3PMwFP3qbRbTf3D`.

13. If the host is `localhost` on `FREENET_PORT`, and the path is not `/`, i.e. **NOT** root path, set `proxy` to `freenet`; and set the first part of its path as `hostname`.

Example:

For a Freenet address, e.g. `http://127.0.0.1:8888/USK@nwa8lHa271k2QvJ8aa0Ov7IHAV-DFOCFgmDt3X6BpCI,DuQSUZiI~agF8c-6tjsFFGuZ8eICrzWCILB60nT8KKo,AQACAAE/sone/77/`, `parse_link()` will parse the hostname as `USK@nwa8lHa271k2QvJ8aa0Ov7IHAV-DFOCFgmDt3X6BpCI,DuQSUZiI~agF8c-6tjsFFGuZ8eICrzWCILB60nT8KKo,AQACAAE`.

14. If the host is a proxied onion (`.onion.sh`) address, set `proxy` to `tor2web`.
15. If none of the cases above satisfied, the `proxy` will be set as `null`, marking it a plain normal link.

The base for parsed link *Link* object is defined as

```
<root>/<proxy>/<scheme>/<hostname>/
```

where `root` is `PATH_DB`.

The name for parsed link *Link* object is the sha256 hash (c.f. `hashlib.sha256()`) of the original link.

`darc.link.quote(string, safe='/', encoding=None, errors=None)`  
Wrapper function for `urllib.parse.quote()`.

**Parameters**

- **string** (*AnyStr*) – string to be quoted
- **safe** (*AnyStr*) – characters not to escape
- **encoding** (*Optional[str]*) – string encoding
- **errors** (*Optional[str]*) – encoding error handler

**Returns** The quoted string.

**Return type** `str`

---

**Note:** The function suppressed possible errors when calling `urllib.parse.quote()`. If any, it will return the original string.

---

`darc.link.unquote(string, encoding='utf-8', errors='replace')`  
Wrapper function for `urllib.parse.unquote()`.

**Parameters**

- **string** (*AnyStr*) – string to be unquoted
- **encoding** (*str*) – string encoding
- **errors** (*str*) – encoding error handler

**Returns** The quoted string.

**Return type** `str`

---

**Note:** The function suppressed possible errors when calling `urllib.parse.unquote()`. If any, it will return the original string.

---

`darc.link.urljoin(base, url, allow_fragments=True)`  
Wrapper function for `urllib.parse.urljoin()`.

**Parameters**

- **base** (*AnyStr*) – base URL
- **url** (*AnyStr*) – URL to be joined
- **allow\_fragments** (*bool*) – if allow fragments

**Returns** The joined URL.

**Return type** `str`

---

**Note:** The function suppressed possible errors when calling `urllib.parse.urljoin()`. If any, it will return `base/url` directly.

---

`darc.link.urlparse(url, scheme='', allow_fragments=True)`  
Wrapper function for `urllib.parse.urlparse()`.

**Parameters**

- **url** (*str*) – URL to be parsed
- **scheme** (*str*) – URL scheme
- **allow\_fragments** (*bool*) – if allow fragments

**Returns** The parse result.

**Return type** `urllib.parse.ParseResult`

---

**Note:** The function suppressed possible errors when calling `urllib.parse.urlparse()`. If any, it will return `urllib.parse.ParseResult(scheme=scheme, netloc='', path=url, params='', query='', fragment='')` directly.

---

`darc.link.urlsplit(url, scheme="", allow_fragments=True)`

Wrapper function for `urllib.parse.urlsplit()`.

**Parameters**

- **url** (*str*) – URL to be split
- **scheme** (*str*) – URL scheme
- **allow\_fragments** (*bool*) – if allow fragments

**Returns** The split result.

**Return type** `urllib.parse.SplitResult`

---

**Note:** The function suppressed possible errors when calling `urllib.parse.urlsplit()`. If any, it will return `urllib.parse.SplitResult(scheme=scheme, netloc='', path=url, params='', query='', fragment='')` directly.

---

## 2.4 Source Parsing

The `darc.parse` module provides auxiliary functions to read `robots.txt`, sitemaps and HTML documents. It also contains utility functions to check if the proxy type, hostname and content type if in any of the black and white lists.

`darc.parse._check(temp_list)`

Check hostname and proxy type of links.

**Parameters** `temp_list` (`List[darc.link.Link]`) – List of links to be checked.

**Returns** List of links matches the requirements.

**Return type** `List[darc.link.Link]`

---

**Note:** If `CHECK_NG` is `True`, the function will directly call `_check_ng()` instead.

---

**See also:**

- `darc.parse.match_host()`
- `darc.parse.match_proxy()`

`darc.parse._check_ng(temp_list)`

Check content type of links through HEAD requests.

**Parameters** `temp_list` (`List[darc.link.Link]`) – List of links to be checked.

**Returns** List of links matches the requirements.

**Return type** `List[darc.link.Link]`

**See also:**

- `darc.parse.match_host()`
- `darc.parse.match_proxy()`
- `darc.parse.match_mime()`

`darc.parse.check_robots(link)`

Check if link is allowed in robots.txt.

**Parameters** `link` (`darc.link.Link`) – The link object to be checked.

**Returns** If link is allowed in robots.txt.

**Return type** `bool`

---

**Note:** The root path of a URL will always return `True`.

---

`darc.parse.extract_links(link, html, check=False)`

Extract links from HTML document.

**Parameters**

- `link` (`darc.link.Link`) – Original link of the HTML document.
- `html` (`Union[str, bytes]`) – Content of the HTML document.
- `check` (`bool`) – If perform checks on extracted links, default to `CHECK`.

**Returns** List of extracted links.

**Return type** `List[darc.link.Link]`

**See also:**

- `darc.parse._check()`
- `darc.parse._check_ng()`

`darc.parse.extract_links_from_text(link, text)`

Extract links from raw text source.

**Parameters**

- `link` (`darc.link.Link`) – Original link of the source document.
- `text` (`str`) – Content of source text document.

**Returns** List of extracted links.

**Return type** `List[darc.link.Link]`

---

**Important:** The extraction is **NOT** as reliable since we did not perform TLD checks on the extracted links and we cannot guarantee all links to be extracted.

The URL patterns used to extract links are defined by `darc.parse.URL_PAT` and you may register your own expressions by `DARC_URL_PAT`.

---

`darc.parse.get_content_type(response)`

Get content type from response.

**Parameters** `response` (`requests.Response`) – Response object.

**Returns** The content type from response.

**Return type** `str`

---

**Note:** If the Content-Type header is not defined in response, the function will utilise `magic` to detect its content type.

---

`darc.parse.match_host(host)`

Check if hostname in black list.

**Parameters** `host` (`str`) – Hostname to be checked.

**Returns** If host in black list.

**Return type** `bool`

---

**Note:** If host is `None`, then it will always return `True`.

---

**See also:**

- `darc.const.LINK_WHITE_LIST`
- `darc.const.LINK_BLACK_LIST`
- `darc.const.LINK_FALLBACK`

`darc.parse.match_mime(mime)`

Check if content type in black list.

**Parameters** `mime` (`str`) – Content type to be checked.

**Returns** If mime in black list.

**Return type** `bool`

**See also:**

- `darc.const.MIME_WHITE_LIST`
- `darc.const.MIME_BLACK_LIST`
- `darc.const.MIME_FALLBACK`

`darc.parse.match_proxy(proxy)`

Check if proxy type in black list.

**Parameters** `proxy` (`str`) – Proxy type to be checked.

**Returns** If proxy in black list.

**Return type** `bool`

---

**Note:** If proxy is script, then it will always return `True`.

---

**See also:**

- `darc.const.PROXY_WHITE_LIST`
- `darc.const.PROXY_BLACK_LIST`
- `darc.const.PROXY_FALLBACK`

`darc.parse.URL_PAT: List[re.Pattern]`

Regular expression patterns to match all reasonable URLs.

Currently, we have two builtin patterns:

1. HTTP(S) and other *regular* URLs, e.g. WebSocket, IRC, etc.

```
re.compile(r'(?P<url>((https?|wss?|irc):)?(//)?\w+(\.\w+)+/?\S*)', re.UNICODE),
```

2. Bitcoin accounts, data URIs, (ED2K) magnet links, email addresses, telephone numbers, JavaScript functions, etc.

```
re.compile(r'(?P<url>(bitcoin|data|ed2k|magnet|mailto|script|tel):\w+)', re.ASCII)
```

**Environ** `DARC_URL_PAT`

**See also:**

The patterns are used in `darc.parse.extract_links_from_text()`.

## 2.5 Source Saving

The `darc.save` module contains the core utilities for managing fetched files and documents.

The data storage under the root path (`PATH_DB`) is typically as following:

```
data
├── api
│   └── <date>
│       └── <proxy>
│           └── <scheme>
│               └── <hostname>
│                   ├── new_host
│                   │   └── <hash>_<timestamp>.json
│                   ├── requests
│                   │   └── <hash>_<timestamp>.json
│                   └── selenium
│                       └── <hash>_<timestamp>.json
├── link.csv
└── misc
```

(continues on next page)

(continued from previous page)

```

├── bitcoin.txt
├── data
│   └── <hash>_<timestamp>.<ext>
├── ed2k.txt
├── invalid.txt
├── irc.txt
├── magnet.txt
├── mail.txt
└── <proxy>
    └── <scheme>
        └── <hostname>
            ├── <hash>_<timestamp>.json
            ├── robots.txt
            └── sitemap_<hash>.xml

```

`darc.save.sanitise (link, time=None, raw=False, data=False, headers=False, screenshot=False)`

Sanitise link to path.

#### Parameters

- **link** (`darc.link.Link`) – Link object to sanitise the path
- **time** (`datetime`) – Timestamp for the path.
- **raw** (`bool`) – If this is a raw HTML document from `requests`.
- **data** (`bool`) – If this is a generic content type document.
- **headers** (`bool`) – If this is response headers from `requests`.
- **screenshot** (`bool`) – If this is the screenshot from `selenium`.

#### Returns

- If `raw` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>_raw.html`.
- If `data` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.dat`.
- If `headers` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.json`.
- If `screenshot` is `True`, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.png`.
- If none above, `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.html`.

#### Return type `str`

#### See also:

- `darc.crawl.crawler()`
- `darc.crawl.loader()`

`darc.save.save_headers (time, link, response, session)`

Save HTTP response headers.

#### Parameters

- **time** (`datetime`) – Timestamp of response.

- **link** (`darc.link.Link`) – Link object of response.
- **response** (`requests.Response`) – Response object to be saved.
- **session** (`requests.Session`) – Session object of response.

**Returns** Saved path to response headers, i.e. `<root>/<proxy>/<scheme>/<hostname>/<hash>_<timestamp>.json`.

**Return type** `str`

The JSON data saved is as following:

```
{
  "[metadata]": {
    "url": "...",
    "proxy": "...",
    "host": "...",
    "base": "...",
    "name": "..."
  },
  "Timestamp": "...",
  "URL": "...",
  "Method": "GET",
  "Status-Code": "...",
  "Reason": "...",
  "Cookies": {
    "...": "..."
  },
  "Session": {
    "...": "..."
  },
  "Request": {
    "...": "..."
  },
  "Response": {
    "...": "..."
  },
  "History": [
    { "...": "..." }
  ]
}
```

**See also:**

- `darc.save.sanitise()`
- `darc.crawl.crawler()`

`darc.save.save_link(link)`

Save link hash database `link.csv`.

The CSV file has following fields:

- proxy type: `link.proxy`
- URL scheme: `link.url_parse.scheme`
- hostname: `link.base`
- link hash: `link.name`
- original URL: `link.url`

**Parameters** `link` (`darc.link.Link`) – Link object to be saved.

**Return type** `None`

**See also:**

- `darc.const.PATH_LN`
- `darc.save._SAVE_LOCK`

`darc.save._SAVE_LOCK`: `Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving link hash database `link.csv`.

**See also:**

- `darc.save.save_link()`
- `darc.const.get_lock()`

## 2.6 Link Database

The `darc` project utilises `Redis` based database to provide tele-process communication.

---

**Note:** In its first implementation, the `darc` project used `Queue` to support such communication. However, as noticed when runtime, the `Queue` object will be much affected by the lack of memory.

---

There will be three databases, all following the save naming convention with `queue_` prefix:

- the hostname database – `queue_hostname` (`HostnameQueueModel`)
- the `requests` database – `queue_requests` (`RequestsQueueModel`)
- the selenium database – `queue_selenium` (`SeleniumQueueModel`)

For `queue_hostname`, `queue_requests` and `queue_selenium`, they are all `Redis sorted set` data type.

If `FLAG_DB` is `True`, then the module uses the RDS storage described by the `peewee` models as backend.

`darc.db._db_operation` (`operation`, `*args`, `**kwargs`)

Retry operation on database.

**Parameters**

- **operation** (`Callable[[...], T]`) – Callable / method to perform.
- **\*args** – Arbitrary positional arguments.

**Keyword Arguments** **\*\*kwargs** – Arbitrary keyword arguments.

**Returns** Any return value from a successful operation call.

**Return type** `T`

`darc.db._drop_hostname_db` (`link`)

Remove link from the hostname database.

The function updates the `HostnameQueueModel` table.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._drop_hostname_redis(link)`

Remove link from the hostname database.

The function updates the `queue_hostname` database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._drop_requests_db(link)`

Remove link from the `requests` database.

The function updates the `RequestsQueueModel` table.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._drop_requests_redis(link)`

Remove link from the `requests` database.

The function updates the `queue_requests` database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._drop_selenium_db(link)`

Remove link from the `selenium` database.

The function updates the `SeleniumQueueModel` table.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._drop_selenium_redis(link)`

Remove link from the `selenium` database.

The function updates the `queue_selenium` database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

`darc.db._gen_arg_msg(*args, **kwargs)`

Sanitise arguments representation string.

**Parameters** `*args` – Arbitrary arguments.

**Keyword Arguments** `**kwargs` – Arbitrary keyword arguments.

**Returns** Sanitised arguments representation string.

**Return type** `str`

`darc.db._have_hostname_db(link)`

Check if current link is a new host.

The function checks the `HostnameQueueModel` table.

**Parameters** `link` (`darc.link.Link`) – Link to check against.

**Returns** A tuple of two `bool` values representing if such link is a known host and needs force refetch respectively.

**Return type** `Tuple[bool, bool]`

---

```
darc.db._have_hostname_redis(link)
```

Check if current link is a new host.

The function checks the `queue_hostname` database.

**Parameters** `link` (`darc.link.Link`) – Link to check against.

**Returns** A tuple of two `bool` values representing if such link is a known host and needs force refetch respectively.

**Return type** `Tuple[bool, bool]`

```
darc.db._load_requests_db()
```

Load link from the `requests` database.

The function reads the `RequestsQueueModel` table.

**Returns** List of loaded links from the `requests` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

```
darc.db._load_requests_redis()
```

Load link from the `requests` database.

The function reads the `queue_requests` database.

**Returns** List of loaded links from the `requests` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

```
darc.db._load_selenium_db()
```

Load link from the `selenium` database.

The function reads the `SeleniumQueueModel` table.

**Returns** List of loaded links from the `selenium` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

```
darc.db._load_selenium_redis()
```

Load link from the `selenium` database.

The function reads the `queue_selenium` database.

**Parameters** `check` – If perform checks on loaded links, default to `CHECK`.

**Returns** List of loaded links from the `selenium` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

`darc.db._redis_command(command, *args, **kwargs)`

Wrapper function for Redis command.

**Parameters**

- **command** (*str*) – Command name.
- **\*args** – Arbitrary arguments for the Redis command.

**Keyword Arguments** **\*\*kwargs** – Arbitrary keyword arguments for the Redis command.

**Returns** Values returned from the Redis command.

**Warns** **RedisCommandFailed** – Warns at each round when the command failed.

**Return type** Any

**See also:**

Between each retry, the function sleeps for `RETRY_INTERVAL` second(s) if such value is **NOT** `None`.

`darc.db._redis_get_lock(name, timeout=None, sleep=0.1, blocking_timeout=None, lock_class=None, thread_local=True)`

Get a lock for Redis operations.

**Parameters**

- **name** (*str*) – Lock name.
- **timeout** (*Optional[float]*) – Maximum life for the lock.
- **sleep** (*float*) – Amount of time to sleep per loop iteration when the lock is in blocking mode and another client is currently holding the lock.
- **blocking\_timeout** (*Optional[float]*) – Maximum amount of time in seconds to spend trying to acquire the lock.
- **lock\_class** (*Optional[redis.lock.Lock]*) – Lock implementation.
- **thread\_local** (*bool*) – Whether the lock token is placed in thread-local storage.

**Returns** Return a new `redis.lock.Lock` object using key name that mimics the behavior of `threading.Lock`.

**Return type** Union[`redis.lock.Lock`, `contextlib.nullcontext`]

**See Also:** If `REDIS_LOCK` is `False`, returns a `contextlib.nullcontext` instead.

`darc.db._save_requests_db(entries, single=False, score=None, nx=False, xx=False)`

Save link to the `requests` database.

The function updates the `RequestsQueueModel` table.

**Parameters**

- **entries** (*Union[darc.link.Link, List[darc.link.Link]]*) – Links to be added to the `requests` database. It can be either a `list` of links, or a single link string (if `single` set as `True`).
- **single** (*bool*) – Indicate if `entries` is a `list` of links or a single link string.
- **score** (*Optional[float]*) – Score to for the Redis sorted set.

- **nx** (*bool*) – Only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

`darc.db._save_requests_redis` (*entries*, *single=False*, *score=None*, *nx=False*, *xx=False*)

Save link to the `requests` database.

The function updates the `queue_requests` database.

#### Parameters

- **entries** (*Union[darc.link.Link, List[darc.link.Link]]*) – Links to be added to the `requests` database. It can be either a `list` of links, or a single link string (if `single` set as `True`).
- **single** (*bool*) – Indicate if `entries` is a `list` of links or a single link string.
- **score** (*Optional[float]*) – Score to for the Redis sorted set.
- **nx** (*bool*) – Forces `ZADD` to only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Forces `ZADD` to only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

`darc.db._save_selenium_db` (*entries*, *single=False*, *score=None*, *nx=False*, *xx=False*)

Save link to the `selenium` database.

The function updates the `SeleniumQueueModel` table.

#### Parameters

- **entries** (*Union[darc.link.Link, List[darc.link.Link]]*) – Links to be added to the `selenium` database. It can be either a `list` of links, or a single link string (if `single` set as `True`).
- **single** (*bool*) – Indicate if `entries` is a `list` of links or a single link string.
- **score** (*Optional[float]*) – Score to for the Redis sorted set.
- **nx** (*bool*) – Only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

`darc.db._save_selenium_redis` (*entries*, *single=False*, *score=None*, *nx=False*, *xx=False*)

Save link to the `selenium` database.

The function updates the `queue_selenium` database.

#### Parameters

- **entries** (*Union[darc.link.Link, List[darc.link.Link]]*) – Links to be added to the `selenium` database. It can be either an *iterable* of links, or a single link string (if `single` set as `True`).
- **single** (*bool*) – Indicate if `entries` is an *iterable* of links or a single link string.

- **score** (*Optional[float]*) – Score to for the Redis sorted set.
- **nx** (*bool*) – Forces ZADD to only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Forces ZADD to only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

When `entries` is a list of `Link` instances, we tries to perform *bulk* update to easy the memory consumption. The *bulk* size is defined by `BULK_SIZE`.

---

### Notes

The `entries` will be dumped through `pickle` so that `darc` do not need to parse them again.

---

`darc.db.drop_hostname(link)`

Remove link from the hostname database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

**See also:**

- `darc.db._drop_hostname_db()`
- `darc.db._drop_hostname_redis()`

`darc.db.drop_requests(link)`

Remove link from the `requests` database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

**See also:**

- `darc.db._drop_requests_db()`
- `darc.db._drop_requests_redis()`

`darc.db.drop_selenium(link)`

Remove link from the selenium database.

**Parameters** `link` (`darc.link.Link`) – Link to be removed.

**Return type** `None`

**See also:**

- `darc.db._drop_selenium_db()`
- `darc.db._drop_selenium_redis()`

`darc.db.have_hostname(link)`

Check if current link is a new host.

**Parameters** `link` (`darc.link.Link`) – Link to check against.

**Returns** A tuple of two `bool` values representing if such link is a known host and needs force refetch respectively.

**Return type** `Tuple[bool, bool]`

See also:

- `darc.db._have_hostname_db()`
- `darc.db._have_hostname_redis()`

`darc.db.load_requests(check=False)`  
Load link from the `requests` database.

**Parameters** `check (bool)` – If perform checks on loaded links, default to `CHECK`.

**Returns** List of loaded links from the `requests` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

See also:

- `darc.db._load_requests_db()`
- `darc.db._load_requests_redis()`

`darc.db.load_selenium(check=False)`  
Load link from the `selenium` database.

**Parameters** `check (bool)` – If perform checks on loaded links, default to `CHECK`.

**Returns** List of loaded links from the `selenium` database.

**Return type** `List[darc.link.Link]`

---

**Note:** At runtime, the function will load links with maximum number at `MAX_POOL` to limit the memory usage.

---

See also:

- `darc.db._load_selenium_db()`
- `darc.db._load_selenium_redis()`

`darc.db.save_requests(entries, single=False, score=None, nx=False, xx=False)`  
Save link to the `requests` database.

The function updates the `queue_requests` database.

**Parameters**

- **entries** (`Union[darc.link.Link, List[darc.link.Link]]`) – Links to be added to the `requests` database. It can be either a `list` of links, or a single link string (if `single` set as `True`).
- **single** (`bool`) – Indicate if `entries` is a `list` of links or a single link string.

- **score** (*Optional[float]*) – Score to for the Redis sorted set.
- **nx** (*bool*) – Only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

---

#### Notes

The `entries` will be dumped through `pickle` so that `darc` do not need to parse them again.

---

When `entries` is a list of `Link` instances, we tries to perform *bulk* update to easy the memory consumption. The *bulk* size is defined by `BULK_SIZE`.

**See also:**

- `darc.db._save_requests_db()`
- `darc.db._save_requests_redis()`

`darc.db.save_selenium(entries, single=False, score=None, nx=False, xx=False)`  
Save link to the selenium database.

#### Parameters

- **entries** (*Union[darc.link.Link, List[darc.link.Link]]*) – Links to be added to the selenium database. It can be either a `list` of links, or a single link string (if single set as `True`).
- **single** (*bool*) – Indicate if `entries` is a `list` of links or a single link string.
- **score** (*Optional[float]*) – Score to for the Redis sorted set.
- **nx** (*bool*) – Only create new elements and not to update scores for elements that already exist.
- **xx** (*bool*) – Only update scores of elements that already exist. New elements will not be added.

**Return type** `None`

---

#### Notes

The `entries` will be dumped through `pickle` so that `darc` do not need to parse them again.

---

When `entries` is a list of `Link` instances, we tries to perform *bulk* update to easy the memory consumption. The *bulk* size is defined by `BULK_SIZE`.

**See also:**

- `darc.db._save_selenium_db()`
- `darc.db._save_selenium_redis()`

`darc.db.BULK_SIZE: int`

**Default** `100`

**Environ** `DARC_BULK_SIZE`

Bulk size for updating Redis databases.

**See also:**

- `darc.db.save_requests()`
- `darc.db.save_selenium()`

`darc.db.LOCK_TIMEOUT: Optional[float]`

**Default** 10

**Environ** `DARC_LOCK_TIMEOUT`

Lock blocking timeout.

---

**Note:** If is an infinit `inf`, no timeout will be applied.

---

**See also:**

Get a lock from `darc.db.get_lock()`.

`darc.db.MAX_POOL: int`

**Default** 1\_000

**Environ** `DARC_MAX_POOL`

Maximum number of links loading from the database.

---

**Note:** If is an infinit `inf`, no limit will be applied.

---

`darc.db.REDIS_LOCK: bool`

**Default** `False`

**Environ** `DARC_REDIS_LOCK`

If use Redis (Lua) lock to ensure process/thread-safely operations.

**See also:**

Toggles the behaviour of `darc.db.get_lock()`.

`darc.db.RETRY_INTERVAL: int`

**Default** 10

**Environ** `DARC_RETRY`

Retry interval between each Redis command failure.

---

**Note:** If is an infinit `inf`, no interval will be applied.

---

**See also:**

Toggles the behaviour of `darc.db.redis_command()`.

## 2.7 Data Submission

The *darc* project integrates the capability of submitting fetched data and information to a web server, to support real-time cross-analysis and status display.

There are three submission events:

1. New Host Submission – *API\_NEW\_HOST*

Submitted in *crawler()* function call, when the crawling URL is marked as a new host.

2. Requests Submission – *API\_REQUESTS*

Submitted in *crawler()* function call, after the crawling process of the URL using *requests*.

3. Selenium Submission – *API\_SELENIUM*

Submitted in *loader()* function call, after the loading process of the URL using *selenium*.

**See also:**

Please refer to *data schema* for more information about the submission data.

`darc.submit.get_hosts(link)`

Read `hosts.txt`.

**Parameters** `link` (`darc.link.Link`) – Link object to read `hosts.txt`.

**Returns**

- If `hosts.txt` exists, return the data from `hosts.txt`.
  - `path` – relative path from `hosts.txt` to root of data storage *PATH\_DB*, `<proxy>/<scheme>/<hostname>/hosts.txt`
  - `data` – *base64* encoded content of `hosts.txt`
- If not, return `None`.

**Return type** `Optional[Dict[str, AnyStr]]`

**See also:**

- `darc.crawl.crawler()`
- `darc.proxy.i2p.save_hosts()`

`darc.submit.get_metadata(link)`

Generate metadata field.

**Parameters** `link` (`darc.link.Link`) – Link object to generate metadata.

**Returns**

The metadata from `link`.

- `url` – original URL, `link.url`
- `proxy` – proxy type, `link.proxy`
- `host` – hostname, `link.host`
- `base` – base path, `link.base`
- `name` – link hash, `link.name`

**Return type** `Dict[str, str]`

`darc.submit.get_robots(link)`

Read robots.txt.

**Parameters** `link` (`darc.link.Link`) – Link object to read robots.txt.

**Returns**

- If robots.txt exists, return the data from robots.txt.
  - path – relative path from robots.txt to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/robots.txt`
  - data – *base64* encoded content of robots.txt
- If not, return `None`.

**Return type** `Optional[Dict[str, AnyStr]]`

**See also:**

- `darc.crawl.crawler()`
- `darc.proxy.null.save_robots()`

`darc.submit.get_sitemaps(link)`

Read sitemaps.

**Parameters** `link` (`darc.link.Link`) – Link object to read sitemaps.

**Returns**

- If sitemaps exist, return list of the data from sitemaps.
  - path – relative path from sitemap to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml`
  - data – *base64* encoded content of sitemap
- If not, return `None`.

**Return type** `Optional[List[Dict[str, AnyStr]]]`

**See also:**

- `darc.crawl.crawler()`
- `darc.proxy.null.save_sitemap()`

`darc.submit.save_submit(domain, data)`

Save failed submit data.

**Parameters**

- **domain** (`'new_host'`, `'requests'` or `'selenium'`) – Domain of the submit data.
- **data** (`Dict[str, Any]`) – Submit data.

**Return type** `None`

---

**Notes**

The saved files will be categorised by the actual runtime day for better maintenance.

---

**See also:**

- `darc.submit.PATH_API`
- `darc.submit.submit()`
- `darc.submit.submit_new_host()`
- `darc.submit.submit_requests()`
- `darc.submit.submit_selenium()`

`darc.submit.submit(api, domain, data)`  
Submit data.

#### Parameters

- **api** (*str*) – API URL.
- **domain** ('new\_host', 'requests' or 'selenium') – Domain of the submit data.
- **data** (*Dict[str, Any]*) – Submit data.

**Return type** `None`

See also:

- `darc.submit.API_RETRY`
- `darc.submit.save_submit()`
- `darc.submit.submit_new_host()`
- `darc.submit.submit_requests()`
- `darc.submit.submit_selenium()`

`darc.submit.submit_new_host(time, link, partial=False, force=False)`  
Submit new host.

When a new host is discovered, the `darc` crawler will submit the host information. Such includes `robots.txt` (if exists) and `sitemap.xml` (if any).

#### Parameters

- **time** (*datetime.datetime*) – Timestamp of submission.
- **link** (*darc.link.Link*) – Link object of submission.
- **partial** (*bool*) – If the data is not complete, i.e. failed when fetching `robots.txt`, `hosts.txt` and/or `sitemaps`.
- **force** (*bool*) – If the data is force re-fetched, i.e. cache expired when checking with `darc.db.have_hostname()`.

**Return type** `None`

If `API_NEW_HOST` is `None`, the data for submission will directly be save through `save_submit()`.

The data submitted should have following format:

```
{
  // partial flag - true / false
  "$PARTIAL$": ...,
  // force flag - true / false
  "$FORCE$": ...,
  // metadata of URL
```

(continues on next page)

(continued from previous page)

```

"[metadata]": {
    // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
    "url": ...,
    // proxy type - null / tor / i2p / zeronet / freenet
    "proxy": ...,
    // hostname / netloc, c.f. ``urllib.parse.urlparse``
    "host": ...,
    // base folder, relative path (to data root path ``PATH_DATA``) in_
    ↪container - <proxy>/<scheme>/<host>
    "base": ...,
    // sha256 of URL as name for saved files (timestamp is in ISO format)
    //   JSON log as this one - <base>/<name>_<timestamp>.json
    //   HTML from requests - <base>/<name>_<timestamp>_raw.html
    //   HTML from selenium - <base>/<name>_<timestamp>.html
    //   generic data files - <base>/<name>_<timestamp>.dat
    "name": ...
},
// requested timestamp in ISO format as in name of saved file
"Timestamp": ...,
// original URL
"URL": ...,
// robots.txt from the host (if not exists, then ``null``)
"Robots": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in_
    ↪container
    //   - <proxy>/<scheme>/<host>/robots.txt
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
},
// sitemaps from the host (if none, then ``null``)
"Sitemaps": [
    {
        // path of the file, relative path (to data root path ``PATH_DATA``) ↪
        ↪in container
        //   - <proxy>/<scheme>/<host>/sitemap_<name>.xml
        "path": ...,
        // content of the file (**base64** encoded)
        "data": ...,
    },
    ...
],
// hosts.txt from the host (if proxy type is ``i2p``; if not exists, then_
    ↪``null``)
"Hosts": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in_
    ↪container
    //   - <proxy>/<scheme>/<host>/hosts.txt
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
}
}

```

- `darc.submit.get_sitemaps()`
- `darc.submit.get_hosts()`

`darc.submit.submit_requests(time, link, response, session, content, mime_type, html=True)`  
Submit requests data.

When crawling, we'll first fetch the URI using `requests`, to check its availability and to save its HTTP headers information. Such information will be submitted to the web UI.

#### Parameters

- **time** (`datetime.datetime`) – Timestamp of submission.
- **link** (`darc.link.Link`) – Link object of submission.
- **response** (`requests.Response`) – Response object of submission.
- **session** (`requests.Session`) – Session object of submission.
- **content** (`bytes`) – Raw content of from the response.
- **mime\_type** (`str`) – Content type.
- **html** (`bool`) – If current document is HTML or other files.

#### Return type `None`

If `API_REQUESTS` is `None`, the data for submission will directly be save through `save_submit()`.

The data submitted should have following format:

```
{
  // metadata of URL
  "[metadata]": {
    // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
    "url": ...,
    // proxy type - null / tor / i2p / zeronet / freenet
    "proxy": ...,
    // hostname / netloc, c.f. ``urllib.parse.urlparse``
    "host": ...,
    // base folder, relative path (to data root path ``PATH_DATA``) in_
    →containter - <proxy>/<scheme>/<host>
    "base": ...,
    // sha256 of URL as name for saved files (timestamp is in ISO format)
    //   JSON log as this one - <base>/<name>_<timestamp>.json
    //   HTML from requests - <base>/<name>_<timestamp>_raw.html
    //   HTML from selenium - <base>/<name>_<timestamp>.html
    //   generic data files - <base>/<name>_<timestamp>.dat
    "name": ...
  },
  // requested timestamp in ISO format as in name of saved file
  "Timestamp": ...,
  // original URL
  "URL": ...,
  // request method
```

(continues on next page)

(continued from previous page)

```

"Method": "GET",
// response status code
"Status-Code": ...,
// response reason
"Reason": ...,
// response cookies (if any)
"Cookies": {
    ...
},
// session cookies (if any)
"Session": {
    ...
},
// request headers (if any)
"Request": {
    ...
},
// response headers (if any)
"Response": {
    ...
},
// content type
"Content-Type": ...,
// requested file (if not exists, then ``null``)
"Document": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in_
    ↪container
    // - <proxy>/<scheme>/<host>/<name>_<timestamp>_raw.html
    // or if the document is of generic content type, i.e. not HTML
    // - <proxy>/<scheme>/<host>/<name>_<timestamp>.dat
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
},
// redirection history (if any)
"History": [
    // same record data as the original response
    {"...": "..."}
]
}

```

**See also:**

- `darc.submit.API_REQUESTS`

- `darc.submit.save_submit()`
- `darc.submit.get_metadata()`
- `darc.submit.get_raw()`
- `darc.crawl.crawler()`

`darc.submit.submit_selenium(time, link, html, screenshot)`  
 Submit selenium data.

After crawling with `requests`, we'll then render the URL using `selenium` with Google Chrome and its web driver, to provide a fully rendered web page. Such information will be submitted to the web UI.

### Parameters

- **time** (`datetime.datetime`) – Timestamp of submission.
- **link** (`darc.link.Link`) – Link object of submission.
- **html** (`str`) – HTML source of the web page.
- **screenshot** (`Optional[str]`) – `base64` encoded screenshot.

### Return type `None`

If `API_SELENIUM` is `None`, the data for submission will directly be save through `save_submit()`.

**Note:** This information is optional, only provided if the content type from `requests` is HTML, status code not between 400 and 600, and HTML data not empty.

The data submitted should have following format:

```
{
  // metadata of URL
  "[metadata]": {
    // original URL - <scheme>://<netloc>/<path>;<params>?<query>#<fragment>
    "url": ...,
    // proxy type - null / tor / i2p / zeronet / freenet
    "proxy": ...,
    // hostname / netloc, c.f. ``urllib.parse.urlparse``
    "host": ...,
    // base folder, relative path (to data root path ``PATH_DATA``) in_
    ↪container - <proxy>/<scheme>/<host>
    "base": ...,
    // sha256 of URL as name for saved files (timestamp is in ISO format)
    //   JSON log as this one - <base>/<name>_<timestamp>.json
    //   HTML from requests - <base>/<name>_<timestamp>_raw.html
    //   HTML from selenium - <base>/<name>_<timestamp>.html
    //   generic data files - <base>/<name>_<timestamp>.dat
    "name": ...
  },
  // requested timestamp in ISO format as in name of saved file
  "Timestamp": ...,
  // original URL
  "URL": ...,
  // rendered HTML document (if not exists, then ``null``)
  "Document": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in_
    ↪container
    //   - <proxy>/<scheme>/<host>/<name>_<timestamp>.html
    "path": ...,
    // content of the file (**base64** encoded)
    "data": ...,
  },
  // web page screenshot (if not exists, then ``null``)
  "Screenshot": {
    // path of the file, relative path (to data root path ``PATH_DATA``) in_
    ↪container
    //   - <proxy>/<scheme>/<host>/<name>_<timestamp>.png
```

(continues on next page)

(continued from previous page)

```

        "path": ...,
        // content of the file (**base64** encoded)
        "data": ...,
    }
}

```

**See also:**

- `darc.submit.API_SELENIUM`
- `darc.submit.submit()`
- `darc.submit.save_submit()`
- `darc.submit.get_metadata()`
- `darc.submit.get_html()`
- `darc.submit.get_screenshot()`
- `darc.crawl.loader()`

`darc.submit.PATH_API = '{PATH_DB}/api/'`

Path to the API submission records, i.e. `api` folder under the root of data storage.

**See also:**

- `darc.const.PATH_DB`

`darc.submit.SAVE_DB: bool`

Save submitted data to database.

**Default** `True`

**Environ** `SAVE_DB`

`darc.submit.API_RETRY: int`

Retry times for API submission when failure.

**Default** `3`

**Environ** `API_RETRY`

`darc.submit.API_NEW_HOST: str`

API URL for `submit_new_host()`.

**Default** `None`

**Environ** `API_NEW_HOST`

`darc.submit.API_REQUESTS: str`

API URL for `submit_requests()`.

**Default** `None`

**Environ** `API_REQUESTS`

`darc.submit.API_SELENIUM: str`

API URL for `submit_selenium()`.

**Default** `None`

**Environ** `API_SELENIUM`

---

**Note:** If `API_NEW_HOST`, `API_REQUESTS` and `API_SELENIUM` is `None`, the corresponding submit function will save the JSON data in the path specified by `PATH_API`.

---

**See also:**

The `darc` provides a demo on how to implement a `darc`-compliant web backend for the data submission module. See the [demo](#) page for more information.

## 2.8 Requests Wrapper

The `darc.requests` module wraps around the `requests` module, and provides some simple interface for the `darc` project.

`darc.requests.default_user_agent` (*name*='python-darc', *proxy*=None)  
Generates the default user agent.

**Parameters**

- **name** (*str*) – Base name.
- **proxy** (*Optional[str]*) – Proxy type.

**Returns** User agent in format of {name}/{darc.\_\_version\_\_} ({proxy} Proxy).

**Return type** `str`

`darc.requests.i2p_session` (*futures*=False)  
I2P (i2p) session.

**Parameters** **futures** (*bool*) – If returns a `requests_futures.FuturesSession`.

**Returns** The session object with I2P proxy settings.

**Return type** `Union[requests.Session, requests_futures.FuturesSession]`

**See also:**

- `darc.proxy.i2p.I2P_REQUESTS_PROXY`

`darc.requests.null_session` (*futures*=False)  
No proxy session.

**Parameters** **futures** (*bool*) – If returns a `requests_futures.FuturesSession`.

**Returns** The session object with no proxy settings.

**Return type** `Union[requests.Session, requests_futures.FuturesSession]`

`darc.requests.request_session` (*link*, *futures*=False)  
Get requests session.

**Parameters**

- **link** (`darc.link.Link`) – Link requesting for `requests.Session`.
- **futures** (*bool*) – If returns a `requests_futures.FuturesSession`.

**Returns** The session object with corresponding proxy settings.

**Return type** `Union[requests.Session, requests_futures.FuturesSession]`

**Raises** `UnsupportedLink` – If the proxy type of `link` if not specified in the `LINK_MAP`.

See also:

- `darc.proxy.LINK_MAP`

`darc.requests.tor_session` (*futures=False*)

Tor (.onion) session.

**Parameters** `futures` (*bool*) – If returns a `requests_futures.FuturesSession`.

**Returns** The session object with Tor proxy settings.

**Return type** `Union[requests.Session, requests_futures.FuturesSession]`

See also:

- `darc.proxy.tor.TOR_REQUESTS_PROXY`

## 2.9 Selenium Wrapper

The `darc.selenium` module wraps around the `selenium` module, and provides some simple interface for the `darc` project.

`darc.selenium.get_capabilities` (*type='null'*)

Generate desied capabilities.

**Parameters** `type` (*str*) – Proxy type for capabilities.

**Returns** The desied capabilities for the web driver Chrome.

**Raises** `UnsupportedProxy` – If the proxy type is **NOT** `null`, `tor` or `i2p`.

**Return type** `dict`

See also:

- `darc.proxy.tor.TOR_SELENIUM_PROXY`
- `darc.proxy.i2p.I2P_SELENIUM_PROXY`

`darc.selenium.get_options` (*type='null'*)

Generate options.

**Parameters** `type` (*str*) – Proxy type for options.

**Returns** The options for the web driver Chrome.

**Return type** `selenium.webdriver.ChromeOptions`

**Raises**

- `UnsupportedPlatform` – If the operation system is **NOT** `macOS` or `Linux` and `CHROME_BINARY_LOCATION` is **NOT** set.
- `UnsupportedProxy` – If the proxy type is **NOT** `null`, `tor` or `i2p`.

---

**Important:** The function raises `UnsupportedPlatform` in cases where `BINARY_LOCATION` is `None`.

Please provide `CHROME_BINARY_LOCATION` when running `darc` in loader mode on non `macOS` and/or `Linux` systems.

---

**See also:**

- `darc.proxy.tor.TOR_PORT`
- `darc.proxy.i2p.I2P_PORT`

---

- 

`darc.selenium.i2p_driver()`  
I2P(.i2p) driver.

**Returns** The web driver object with I2P proxy settings.

**Return type** `selenium.webdriver.Chrome`

**See also:**

- `darc.selenium.get_options()`
- `darc.selenium.get_capabilities()`

`darc.selenium.null_driver()`  
No proxy driver.

**Returns** The web driver object with no proxy settings.

**Return type** `selenium.webdriver.Chrome`

**See also:**

- `darc.selenium.get_options()`
- `darc.selenium.get_capabilities()`

`darc.selenium.request_driver(link)`  
Get selenium driver.

**Parameters** `link` (`darc.link.Link`) – Link requesting for Chrome.

**Returns** The web driver object with corresponding proxy settings.

**Return type** `selenium.webdriver.Chrome`

**Raises** `UnsupportedLink` – If the proxy type of `link` if not specified in the `LINK_MAP`.

**See also:**

- `darc.proxy.LINK_MAP`

```
darc.selenium.tor_driver()
```

Tor(.onion) driver.

**Returns** The web driver object with Tor proxy settings.

**Return type** selenium.webdriver.Chrome

**See also:**

- `darc.selenium.get_options()`
- `darc.selenium.get_capabilities()`

```
darc.selenium.BINARY_LOCATION: Optional[str]
```

Path to Google Chrome binary location.

**Default** google-chrome

**Environ** CHROME\_BINARY\_LOCATION

## 2.10 Proxy Utilities

The `darc.proxy` module provides various proxy support to the `darc` project.

### 2.10.1 Bitcoin Addresses

The `darc.proxy.bitcoin` module contains the auxiliary functions around managing and processing the bitcoin addresses.

Currently, the `darc` project directly save the bitcoin addresses extracted to the data storage file `PATH` without further processing.

```
darc.proxy.bitcoin.save_bitcoin(link)
```

Save bitcoin address.

The function will save bitcoin address to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the bitcoin address.

**Return type** `None`

```
darc.proxy.bitcoin.PATH = '{PATH_MISC}/bitcoin.txt'
```

Path to the data storage of bitcoin addresses.

**See also:**

- `darc.const.PATH_MISC`

```
darc.proxy.bitcoin.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]
```

I/O lock for saving bitcoin addresses `PATH`.

**See also:**

- `darc.const.get_lock()`

### 2.10.2 Data URI Schemes

The `darc.proxy.data` module contains the auxiliary functions around managing and processing the data URI schemes.

Currently, the `darc` project directly save the data URI schemes extracted to the data storage path `PATH` without further processing.

`darc.proxy.data.save_data(link)`  
Save data URI.

The function will save data URIs to the data storage as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the data URI.

**Return type** `None`

`darc.proxy.data.PATH = '{PATH_MISC}/data/'`  
Path to the data storage of data URI schemes.

**See also:**

- `darc.const.PATH_MISC`

### 2.10.3 ED2K Magnet Links

The `darc.proxy.ed2k` module contains the auxiliary functions around managing and processing the ED2K magnet links.

Currently, the `darc` project directly save the ED2K magnet links extracted to the data storage file `PATH` without further processing.

`darc.proxy.ed2k.save_ed2k(link)`  
Save ed2k magnet link.

The function will save ED2K magnet link to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the ED2K magnet links.

**Return type** `None`

`darc.proxy.ed2k.PATH = '{PATH_MISC}/ed2k.txt'`  
Path to the data storage of bED2K magnet links.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.ed2k.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving ED2K magnet links `PATH`.

**See also:**

- `darc.const.get_lock()`

## 2.10.4 Freenet Proxy

The `darc.proxy.freenet` module contains the auxiliary functions around managing and processing the Freenet proxy.

`darc.proxy.freenet._freenet_bootstrap()`  
Freenet bootstrap.

The bootstrap arguments are defined as `__FREENET_ARGS`.

**Raises** `subprocess.CalledProcessError` – If the return code of `__FREENET_PROC` is non-zero.

**Return type** `None`

**See also:**

- `darc.proxy.freenet.freenet_bootstrap()`
- `darc.proxy.freenet.BS_WAIT`
- `darc.proxy.freenet.__FREENET_BS_FLAG`
- `darc.proxy.freenet.__FREENET_PROC`

`darc.proxy.freenet.freenet_bootstrap()`  
Bootstrap wrapper for Freenet.

The function will bootstrap the Freenet proxy. It will retry for `FREENET_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `__FREENET_BS_FLAG`.

**Warns** `FreenetBootstrapFailed` – If failed to bootstrap Freenet proxy.

**Raises** `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

**Return type** `None`

**See also:**

- `darc.proxy.freenet._freenet_bootstrap()`
- `darc.proxy.freenet.FREENET_RETRY`
- `darc.proxy.freenet.__FREENET_BS_FLAG`

The following constants are configuration through environment variables:

`darc.proxy.freenet.FREENET_PORT: int`  
Port for Freenet proxy connection.

**Default** 8888

**Environ** `FREENET_PORT`

`darc.proxy.freenet.FREENET_RETRY: int`  
Retry times for Freenet bootstrap when failure.

**Default** 3

**Environ** `FREENET_RETRY`

`darc.proxy.freenet.BS_WAIT: float`  
Time after which the attempt to start Freenet is aborted.

**Default** 90

**Environ** `FREENET_WAIT`

---

**Note:** If not provided, there will be **NO** timeouts.

---

`darc.proxy.freenet.FREENET_PATH: str`

Path to the Freenet project.

**Default** `/usr/local/src/freenet`

**Environ** `FREENET_PATH`

`darc.proxy.freenet.FREENET_ARGS: List[str]`

Freenet bootstrap arguments for `run.sh start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

**Default** `''`

**Environ** `FREENET_ARGS`

---

**Note:** The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is `root`.

---

The following constants are defined for internal usage:

`darc.proxy.freenet._MNG_FREENET: bool`

If manage Freenet proxy through `darc`.

**Default** `True`

**Environ** `DARC_FREENET`

`darc.proxy.freenet._FREENET_BS_FLAG: bool`

If the Freenet proxy is bootstrapped.

`darc.proxy.freenet._FREENET_PROC: subprocess.Popen`

Freenet proxy process running in the background.

`darc.proxy.freenet._FREENET_ARGS: List[str]`

Freenet proxy bootstrap arguments.

## 2.10.5 I2P Proxy

The `darc.proxy.i2p` module contains the auxiliary functions around managing and processing the I2P proxy.

`darc.proxy.i2p._i2p_bootstrap()`

I2P bootstrap.

The bootstrap arguments are defined as `_I2P_ARGS`.

**Raises** `subprocess.CallProcessError` – If the return code of `_I2P_PROC` is non-zero.

**Return type** `None`

**See also:**

- `darc.proxy.i2p.i2p_bootstrap()`
- `darc.proxy.i2p.BS_WAIT`
- `darc.proxy.i2p._I2P_BS_FLAG`

- `darc.proxy.i2p._I2P_PROC`

`darc.proxy.i2p.fetch_hosts(link, force=False)`  
Fetch `hosts.txt`.

**Parameters**

- **link** (`darc.link.Link`) – Link object to fetch for its `hosts.txt`.
- **force** (`bool`) – Force refetch `hosts.txt`.

**Returns** Content of the `hosts.txt` file.

**Return type** `None`

`darc.proxy.i2p.get_hosts(link)`  
Read `hosts.txt`.

**Parameters** **link** (`darc.link.Link`) – Link object to read `hosts.txt`.

**Returns**

- If `hosts.txt` exists, return the data from `hosts.txt`.
  - `path` – relative path from `hosts.txt` to root of data storage `PATH_DB`, `<proxy>/<scheme>/<hostname>/hosts.txt`
  - `data` – `base64` encoded content of `hosts.txt`
- If not, return `None`.

**Return type** `Optional[Dict[str, str]]`

**See also:**

- `darc.submit.submit_new_host()`
- `darc.proxy.i2p.save_hosts()`

`darc.proxy.i2p.have_hosts(link)`  
Check if `hosts.txt` already exists.

**Parameters** **link** (`darc.link.Link`) – Link object to check if `hosts.txt` already exists.

**Returns**

- If `hosts.txt` exists, return the path to `hosts.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/hosts.txt`.
- If not, return `None`.

**Return type** `Optional[str]`

`darc.proxy.i2p.i2p_bootstrap()`  
Bootstrap wrapper for I2P.

The function will bootstrap the I2P proxy. It will retry for `I2P_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_I2P_BS_FLAG`.

**Warns** `I2PBootstrapFailed` – If failed to bootstrap I2P proxy.

**Raises** `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

**Return type** `None`

**See also:**

- `darc.proxy.i2p._i2p_bootstrap()`
- `darc.proxy.i2p.I2P_RETRY`
- `darc.proxy.i2p._I2P_BS_FLAG`

`darc.proxy.i2p.read_hosts(text, check=False)`  
Read `hosts.txt`.

**Parameters**

- **text** (*str*) – Content of `hosts.txt`.
- **check** (*bool*) – If perform checks on extracted links, default to `CHECK`.

**Returns** List of links extracted.

**Return type** List[`darc.link.Link`]

`darc.proxy.i2p.save_hosts(link, text)`  
Save `hosts.txt`.

**Parameters**

- **link** (`darc.link.Link`) – Link object of `hosts.txt`.
- **text** (*str*) – Content of `hosts.txt`.

**Returns** Saved path to `hosts.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/hosts.txt`.

**Return type** *str*

**See also:**

- `darc.save.sanitise()`

`darc.proxy.i2p.I2P_REQUESTS_PROXY: Dict[str, Any]`  
Proxy for I2P sessions.

**See also:**

- `darc.requests.i2p_session()`

`darc.proxy.i2p.I2P_SELENIUM_PROXY: selenium.webdriver.common.proxy.Proxy`  
Proxy for I2P web drivers.

**See also:**

- `darc.selenium.i2p_driver()`

The following constants are configuration through environment variables:

`darc.proxy.i2p.I2P_PORT: int`  
Port for I2P proxy connection.

**Default** 4444

**Environ** `I2P_PORT`

`darc.proxy.i2p.I2P_RETRY: int`  
Retry times for I2P bootstrap when failure.

**Default** 3

**Environ** `I2P_RETRY`

`darc.proxy.i2p.BS_WAIT: float`

Time after which the attempt to start I2P is aborted.

**Default** 90

**Environ** `I2P_WAIT`

---

**Note:** If not provided, there will be **NO** timeouts.

---

`darc.proxy.i2p.I2P_ARGS: List[str]`

I2P bootstrap arguments for `i2prouter` start.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

**Default** ''

**Environ** `I2P_ARGS`

---

**Note:** The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is `root`.

---

The following constants are defined for internal usage:

`darc.proxy.i2p._MNG_I2P: bool`

If manage I2P proxy through `darc`.

**Default** `True`

**Environ** `DARC_I2P`

`darc.proxy.i2p._I2P_BS_FLAG: bool`

If the I2P proxy is bootstrapped.

`darc.proxy.i2p._I2P_PROC: subprocess.Popen`

I2P proxy process running in the background.

`darc.proxy.i2p._I2P_ARGS: List[str]`

I2P proxy bootstrap arguments.

## 2.10.6 IRC Addresses

The `darc.proxy.irc` module contains the auxiliary functions around managing and processing the IRC addresses.

Currently, the `darc` project directly save the IRC addresses extracted to the data storage file `PATH` without further processing.

`darc.proxy.irc.save_irc(link)`

Save IRC address.

The function will save IRC address to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the IRC address.

**Return type** `None`

`darc.proxy.irc.PATH = '{PATH_MISC}/irc.txt'`

Path to the data storage of IRC addresses.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.irc.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving IRC addresses `PATH`.

**See also:**

- `darc.const.get_lock()`

## 2.10.7 Magnet Links

The `darc.proxy.magnet` module contains the auxiliary functions around managing and processing the magnet links.

Currently, the `darc` project directly save the magnet links extracted to the data storage file `PATH` without further processing.

`darc.proxy.magnet.save_magnet(link)`  
Save magnet link.

The function will save magnet link to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the magnet link

**Return type** `None`

`darc.proxy.magnet.PATH = '{PATH_MISC}/magnet.txt'`  
Path to the data storage of magnet links.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.magnet.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving magnet links `PATH`.

**See also:**

- `darc.const.get_lock()`

## 2.10.8 Email Addresses

The `darc.proxy.mail` module contains the auxiliary functions around managing and processing the email addresses.

Currently, the `darc` project directly save the email addresses extracted to the data storage file `PATH` without further processing.

`darc.proxy.mail.save_mail(link)`  
Save email address.

The function will save email address to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the email address.

**Return type** `None`

`darc.proxy.mail.PATH = '{PATH_MISC}/mail.txt'`  
 Path to the data storage of email addresses.

See also:

- `darc.const.PATH_MISC`

`darc.proxy.mail.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
 I/O lock for saving email addresses `PATH`.

See also:

- `darc.const.get_lock()`

## 2.10.9 No Proxy

The `darc.proxy.null` module contains the auxiliary functions around managing and processing normal websites with no proxy.

`darc.proxy.null.fetch_sitemap(link, force=False)`  
 Fetch sitemap.

The function will first fetch the `robots.txt`, then fetch the sitemaps accordingly.

### Parameters

- **link** (`darc.link.Link`) – Link object to fetch for its sitemaps.
- **force** (`bool`) – Force refetch its sitemaps.

**Returns** Contents of `robots.txt` and sitemaps.

**Return type** `None`

See also:

- `darc.proxy.null.read_robots()`
- `darc.proxy.null.read_sitemap()`
- `darc.parse.get_sitemap()`

`darc.proxy.null.get_sitemap(link, text, host=None)`  
 Fetch link to other sitemaps from a sitemap.

### Parameters

- **link** (`darc.link.Link`) – Original link to the sitemap.
- **text** (`str`) – Content of the sitemap.
- **host** (`Optional[str]`) – Hostname of the URL to the sitemap, the value may not be same as in `link`.

**Returns** List of link to sitemaps.

**Return type** List[`darc.link.Link`]

---

**Note:** As specified in the sitemap protocol, it may contain links to other sitemaps.\*<sup>0</sup>

---

<sup>0</sup> <https://www.sitemaps.org/protocol.html#index>

`darc.proxy.null.have_robots(link)`

Check if `robots.txt` already exists.

**Parameters** `link` (`darc.link.Link`) – Link object to check if `robots.txt` already exists.

**Returns**

- If `robots.txt` exists, return the path to `robots.txt`, i.e. `<root>/<proxy>/<scheme>/<hostname>/robots.txt`.
- If not, return `None`.

**Return type** `Optional[str]`

`darc.proxy.null.have_sitemap(link)`

Check if `sitemap` already exists.

**Parameters** `link` (`darc.link.Link`) – Link object to check if `sitemap` already exists.

**Returns**

- If `sitemap` exists, return the path to the `sitemap`, i.e. `<root>/<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml`.
- If not, return `None`.

**Return type** `Optional[str]`

`darc.proxy.null.read_robots(link, text, host=None)`

Read `robots.txt` to fetch link to sitemaps.

**Parameters**

- **link** (`darc.link.Link`) – Original link to `robots.txt`.
- **text** (`str`) – Content of `robots.txt`.
- **host** (`Optional[str]`) – Hostname of the URL to `robots.txt`, the value may not be same as in `link`.

**Returns** List of link to sitemaps.

**Return type** `List[darc.link.Link]`

---

**Note:** If the link to `sitemap` is not specified in `robots.txt`<sup>0</sup>, the fallback link `/sitemap.xml` will be used.

---

`darc.proxy.null.read_sitemap(link, text, check=False)`

Read `sitemap`.

**Parameters**

- **link** (`darc.link.Link`) – Original link to the `sitemap`.
- **text** (`str`) – Content of the `sitemap`.
- **check** (`bool`) – If perform checks on extracted links, default to `CHECK`.

**Returns** List of links extracted.

**Return type** `List[darc.link.Link]`

**See also:**

---

<sup>0</sup> [https://www.sitemaps.org/protocol.html#submit\\_robots](https://www.sitemaps.org/protocol.html#submit_robots)

- `darc.parse._check()`
- `darc.parse._check_ng()`

`darc.proxy.null.save_invalid(link)`  
Save link with invalid scheme.

The function will save link with invalid scheme to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the link with invalid scheme.

**Return type** `None`

`darc.proxy.null.save_robots(link, text)`  
Save robots.txt.

**Parameters**

- `link` (`darc.link.Link`) – Link object of robots.txt.
- `text` (`str`) – Content of robots.txt.

**Returns** Saved path to robots.txt, i.e. `<root>/<proxy>/<scheme>/<hostname>/robots.txt`.

**Return type** `str`

**See also:**

- `darc.save.sanitise()`

`darc.proxy.null.save_sitemap(link, text)`  
Save sitemap.

**Parameters**

- `link` (`darc.link.Link`) – Link object of sitemap.
- `text` (`str`) – Content of sitemap.

**Returns** Saved path to sitemap, i.e. `<root>/<proxy>/<scheme>/<hostname>/sitemap_<hash>.xml`.

**Return type** `str`

**See also:**

- `darc.save.sanitise()`

`darc.proxy.null.PATH = '{PATH_MISC}/invalid.txt'`  
Path to the data storage of links with invalid scheme.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.null.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving links with invalid scheme `PATH`.

**See also:**

- `darc.const.get_lock()`

### 2.10.10 JavaScript Links

The `darc.proxy.script` module contains the auxiliary functions around managing and processing the JavaScript links.

Currently, the `darc` project directly save the JavaScript links extracted to the data storage path `PATH` without further processing.

`darc.proxy.script.save_script(link)`  
Save JavaScript link.

The function will save JavaScript link to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the JavaScript link.

**Return type** `None`

`darc.proxy.script.PATH = '{PATH_MISC}/script.txt'`  
Path to the data storage of bitcoin addresses.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.script.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving JavaScript links `PATH`.

**See also:**

- `darc.const.get_lock()`

### 2.10.11 Telephone Numbers

The `darc.proxy.tel` module contains the auxiliary functions around managing and processing the telephone numbers.

Currently, the `darc` project directly save the telephone numbers extracted to the data storage file `PATH` without further processing.

`darc.proxy.tel.save_tel(link)`  
Save telephone number.

The function will save telephone number to the file as defined in `PATH`.

**Parameters** `link` (`darc.link.Link`) – Link object representing the telephone number.

**Return type** `None`

`darc.proxy.tel.PATH = '{PATH_MISC}/tel.txt'`  
Path to the data storage of bitcoin addresses.

**See also:**

- `darc.const.PATH_MISC`

`darc.proxy.tel.LOCK: Union[multiprocessing.Lock, threading.Lock, contextlib.nullcontext]`  
I/O lock for saving telephone numbers `PATH`.

**See also:**

- `darc.const.get_lock()`

## 2.10.12 Tor Proxy

The `darc.proxy.tor` module contains the auxiliary functions around managing and processing the Tor proxy.

`darc.proxy.tor._tor_bootstrap()`

Tor bootstrap.

The bootstrap configuration is defined as `_TOR_CONFIG`.

If `TOR_PASS` not provided, the function will request for it.

**See also:**

- `darc.proxy.tor.tor_bootstrap()`
- `darc.proxy.tor.BS_WAIT`
- `darc.proxy.tor.TOR_PASS`
- `darc.proxy.tor._TOR_BS_FLAG`
- `darc.proxy.tor._TOR_PROC`
- `darc.proxy.tor._TOR_CTRL`

**Return type** `None`

`darc.proxy.tor.print_bootstrap_lines(line)`

Print Tor bootstrap lines.

**Parameters** `line (str)` – Tor bootstrap line.

**Return type** `None`

`darc.proxy.tor.renew_tor_session()`

Renew Tor session.

**Return type** `None`

`darc.proxy.tor.tor_bootstrap()`

Bootstrap wrapper for Tor.

The function will bootstrap the Tor proxy. It will retry for `TOR_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_TOR_BS_FLAG`.

**Warns** `TorBootstrapFailed` – If failed to bootstrap Tor proxy.

**Return type** `None`

**See also:**

- `darc.proxy.tor._tor_bootstrap()`
- `darc.proxy.tor.TOR_RETRY`
- `darc.proxy.tor._TOR_BS_FLAG`

`darc.proxy.tor.TOR_REQUESTS_PROXY: Dict[str, Any]`

Proxy for Tor sessions.

**See also:**

- `darc.requests.tor_session()`

`darc.proxy.tor.TOR_SELENIUM_PROXY: selenium.webdriver.common.proxy.Proxy`  
Proxy for Tor web drivers.

See also:

- `darc.selenium.tor_driver()`

The following constants are configuration through environment variables:

`darc.proxy.tor.TOR_PORT: int`  
Port for Tor proxy connection.

**Default** 9050

**Environ** `TOR_PORT`

`darc.proxy.tor.TOR_CTRL: int`  
Port for Tor controller connection.

**Default** 9051

**Environ** `TOR_CTRL`

`darc.proxy.tor.TOR_PASS: str`  
Tor controller authentication token.

**Default** `None`

**Environ** `TOR_PASS`

---

**Note:** If not provided, it will be requested at runtime.

---

`darc.proxy.tor.TOR_RETRY: int`  
Retry times for Tor bootstrap when failure.

**Default** 3

**Environ** `TOR_RETRY`

`darc.proxy.tor.BS_WAIT: float`  
Time after which the attempt to start Tor is aborted.

**Default** 90

**Environ** `TOR_WAIT`

---

**Note:** If not provided, there will be **NO** timeouts.

---

`darc.proxy.tor.TOR_CFG: Dict[str, Any]`  
Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

**Default** `{}`

**Environ** `TOR_CFG`

---

**Note:** If provided, it will be parsed from a JSON encoded string.

---

The following constants are defined for internal usage:

`darc.proxy.tor._MNG_TOR: bool`

If manage Tor proxy through *darc*.

**Default** `True`

**Environ** `DARC_TOR`

`darc.proxy.tor._TOR_BS_FLAG: bool`

If the Tor proxy is bootstrapped.

`darc.proxy.tor._TOR_PROC: subprocess.Popen`

Tor proxy process running in the background.

`darc.proxy.tor._TOR_CTRL: stem.control.Controller`

Tor controller process (`stem.control.Controller`) running in the background.

`darc.proxy.tor._TOR_CONFIG: List[str]`

Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

### 2.10.13 ZeroNet Proxy

The `darc.proxy.zeronet` module contains the auxiliary functions around managing and processing the ZeroNet proxy.

`darc.proxy.zeronet._zeronet_bootstrap()`

ZeroNet bootstrap.

The bootstrap arguments are defined as `_ZERONET_ARGS`.

**Raises** `subprocess.CalledProcessError` – If the return code of `_ZERONET_PROC` is non-zero.

**Return type** `None`

**See also:**

- `darc.proxy.zeronet.zeronet_bootstrap()`
- `darc.proxy.zeronet.BS_WAIT`
- `darc.proxy.zeronet._ZERONET_BS_FLAG`
- `darc.proxy.zeronet._ZERONET_PROC`

`darc.proxy.zeronet.zeronet_bootstrap()`

Bootstrap wrapper for ZeroNet.

The function will bootstrap the ZeroNet proxy. It will retry for `ZERONET_RETRY` times in case of failure.

Also, it will **NOT** re-bootstrap the proxy as is guaranteed by `_ZERONET_BS_FLAG`.

**Warns** `ZeroNetBootstrapFailed` – If failed to bootstrap ZeroNet proxy.

**Raises** `UnsupportedPlatform` – If the system is not supported, i.e. not macOS or Linux.

**Return type** `None`

**See also:**

- `darc.proxy.zeronet._zeronet_bootstrap()`
- `darc.proxy.zeronet.ZERONET_RETRY`

- `darc.proxy.zeronet._ZERONET_BS_FLAG`

The following constants are configuration through environment variables:

`darc.proxy.zeronet.ZERONET_PORT: int`

Port for ZeroNet proxy connection.

**Default** 43110

**Environ** `ZERONET_PORT`

`darc.proxy.zeronet.ZERONET_RETRY: int`

Retry times for ZeroNet bootstrap when failure.

**Default** 3

**Environ** `ZERONET_RETRY`

`darc.proxy.zeronet.BS_WAIT: float`

Time after which the attempt to start ZeroNet is aborted.

**Default** 90

**Environ** `ZERONET_WAIT`

---

**Note:** If not provided, there will be **NO** timeouts.

---

`darc.proxy.zeronet.ZERONET_PATH: str`

Path to the ZeroNet project.

**Default** `/usr/local/src/zeronet`

**Environ** `ZERONET_PATH`

`darc.proxy.zeronet.ZERONET_ARGS: List[str]`

ZeroNet bootstrap arguments for `run.sh start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

**Default** `''`

**Environ** `ZERONET_ARGS`

---

**Note:** The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is `root`.

---

The following constants are defined for internal usage:

`darc.proxy.zeronet._MNG_ZERONET: bool`

If manage ZeroNet proxy through `darc`.

**Default** `True`

**Environ** `DARC_ZERONET`

`darc.proxy.zeronet._ZERONET_BS_FLAG: bool`

If the ZeroNet proxy is bootstrapped.

`darc.proxy.zeronet._ZERONET_PROC: subprocess.Popen`

ZeroNet proxy process running in the background.

`darc.proxy.zeronet._ZERONET_ARGS: List[str]`

ZeroNet proxy bootstrap arguments.

To tell the *darc* project which proxy settings to be used for the `requests.Session` objects and `WebDriver` objects, you can specify such information in the *darc.proxy.LINK\_MAP* mapping dictionary.

`darc.proxy.LINK_MAP: DefaultDict[str, Tuple[types.FunctionType, types.FunctionType]]`

```
LINK_MAP = collections.defaultdict(
    lambda: (darc.requests.null_session, darc.selenium.null_driver),
    dict(
        tor=(darc.requests.tor_session, darc.selenium.tor_driver),
        i2p=(darc.requests.i2p_session, darc.selenium.i2p_driver),
    )
)
```

The mapping dictionary for proxy type to its corresponding `requests.Session` factory function and `WebDriver` factory function.

The fallback value is the no proxy `requests.Session` object (`null_session()`) and `WebDriver` object (`null_driver()`).

**See also:**

- *darc.requests* – `requests.Session` factory functions
- *darc.selenium* – `WebDriver` factory functions

## 2.11 Sites Customisation

As websites may have authentication requirements, etc., over its content, the *darc.sites* module provides sites customisation hooks to both `requests` and `selenium` crawling processes.

---

**Important:** To create a sites customisation, define your class by inheriting `darc.sites.BaseSite` and register it to the *darc* module through *darc.sites.register()*.

---

### 2.11.1 Base Sites Customisation

The *darc.sites.\_abc* module provides the *abstract base class* for sites customisation implementation. All sites customisation **must** inherit from the *BaseSite* exclusively.

---

**Important:** The *BaseSite* class is **NOT** intended to be used directly from the *darc.sites.\_abc* module. Instead, you are recommended to import it from *darc.sites* respectively.

---

```
class darc.sites._abc.BaseSite
```

```
    Bases: object
```

Abstract base class for sites customisation.

```
    static crawler(session, link)
```

Crawler hook for my site.

**Parameters**

- **session** (*requests.sessions.Session*) – Session object with proxy settings.

- **link** (`darc.link.Link`) – Link object to be crawled.

Raises `LinkNoReturn` – This link has no return response.

**Return type** `Union[NoReturn, requests.models.Response]`

**static loader** (`driver, link`)

Loader hook for my site.

**Parameters**

- **driver** (`selenium.webdriver.Chrome`) – Web driver object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be loaded.

Raises `LinkNoReturn` – This link has no return response.

**Return type** `Union[NoReturn, selenium.webdriver.chrome.webdriver.WebDriver]`

**hostname:** `List[str] = None`

Hostnames (**case insensitive**) the sites customisation is designed for.

## 2.11.2 Default Hooks

The `darc.sites.default` module is the fallback for sites customisation.

**class** `darc.sites.default.DefaultSite`

Bases: `darc.sites._abc.BaseSite`

Default hooks.

**static crawler** (`session, link`)

Default crawler hook.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Returns** The final response object with crawled data.

**Return type** `requests.Response`

**See also:**

- `darc.crawl.crawler()`

**static loader** (`driver, link`)

Default loader hook.

When loading, if `SE_WAIT` is a valid time lapse, the function will sleep for such time to wait for the page to finish loading contents.

**Parameters**

- **driver** (`selenium.webdriver.Chrome`) – Web driver object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be loaded.

**Returns** The web driver object with loaded data.

**Return type** `selenium.webdriver.Chrome`

---

**Note:** Internally, selenium will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

---

See also:

- `darc.crawl.loader()`
- `darc.const.SE_WAIT`

### 2.11.3 Bitcoin Addresses

The `darc.sites.bitcoin` module is customised to handle bitcoin addresses.

**class** `darc.sites.bitcoin.Bitcoin`  
 Bases: `darc.sites._abc.BaseSite`

Bitcoin addresses.

**static crawler** (*session, link*)  
 Crawler hook for bitcoin addresses.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Raises** `LinkNoReturn` – This link has no return response.

**Return type** `NoReturn`

**static loader** (*driver, link*)  
 Not implemented.

**Raises** `LinkNoReturn` – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –
- **link** (`darc.link.Link`) –

**Return type** `NoReturn`

### 2.11.4 Data URI Schemes

The `darc.sites.data` module is customised to handle data URI schemes.

**class** `darc.sites.data.DataURI`  
 Bases: `darc.sites._abc.BaseSite`

Data URI schemes.

**static crawler** (*session, link*)  
 Crawler hook for data URIs.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.

- **link** (`darc.link.Link`) – Link object to be crawled.

Raises **`LinkNoReturn`** – This link has no return response.

**Return type** NoReturn

**static loader** (`driver`, `link`)

Not implemented.

Raises **`LinkNoReturn`** – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –
- **link** (`darc.link.Link`) –

**Return type** NoReturn

### 2.11.5 ED2K Magnet Links

The `darc.sites.ed2k` module is customised to handle ED2K magnet links.

**class** `darc.sites.ed2k.ED2K`

Bases: `darc.sites._abc.BaseSite`

ED2K magnet links.

**static crawler** (`session`, `link`)

Crawler hook for ED2K magnet links.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

Raises **`LinkNoReturn`** – This link has no return response.

**Return type** NoReturn

**static loader** (`driver`, `link`)

Not implemented.

Raises **`LinkNoReturn`** – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –
- **link** (`darc.link.Link`) –

**Return type** NoReturn

### 2.11.6 IRC Addresses

The `darc.sites.irc` module is customised to handle IRC addresses.

**class** `darc.sites.irc.IRC`

Bases: `darc.sites._abc.BaseSite`

IRC addresses.

**static crawler** (*session, link*)

Crawler hook for IRC addresses.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Raises** `LinkNoReturn` – This link has no return response.

**Return type** `NoReturn`

**static loader** (*driver, link*)

Not implemented.

**Raises** `LinkNoReturn` – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –
- **link** (`darc.link.Link`) –

**Return type** `NoReturn`

### 2.11.7 Magnet Links

The `darc.sites.magnet` module is customised to handle magnet links.

**class** `darc.sites.magnet.Magnet`

Bases: `darc.sites._abc.BaseSite`

Magnet links.

**static crawler** (*session, link*)

Crawler hook for magnet links.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Raises** `LinkNoReturn` – This link has no return response.

**Return type** `NoReturn`

**static loader** (*driver, link*)

Not implemented.

**Raises** `LinkNoReturn` – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –

- **link** (`darc.link.Link`) –

**Return type** NoReturn

## 2.11.8 Email Addresses

The `darc.sites.mail` module is customised to handle email addresses.

**class** `darc.sites.mail.Email`

Bases: `darc.sites._abc.BaseSite`

Email addresses.

**static crawler** (`session`, `link`)

Crawler hook for email addresses.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Raises** `LinkNoReturn` – This link has no return response.

**Return type** NoReturn

**static loader** (`driver`, `link`)

Not implemented.

**Raises** `LinkNoReturn` – This hook is not implemented.

**Parameters**

- **driver** (`selenium.webdriver.chrome.webdriver.WebDriver`) –
- **link** (`darc.link.Link`) –

**Return type** NoReturn

## 2.11.9 JavaScript Links

The `darc.sites.script` module is customised to handle JavaScript links.

**class** `darc.sites.script.Script`

Bases: `darc.sites._abc.BaseSite`

JavaScript links.

**static crawler** (`session`, `link`)

Crawler hook for JavaScript links.

**Parameters**

- **session** (`requests.Session`) – Session object with proxy settings.
- **link** (`darc.link.Link`) – Link object to be crawled.

**Raises** `LinkNoReturn` – This link has no return response.

**Return type** NoReturn

**static loader** (`driver`, `link`)

Not implemented.

**Raises** `LinkNoReturn` – This hook is not implemented.

**Parameters**

- **driver** (*selenium.webdriver.chrome.webdriver.WebDriver*) –
- **link** (*darc.link.Link*) –

**Return type** NoReturn

## 2.11.10 Telephone Numbers

The *darc.sites.tel* module is customised to handle telephone numbers.

**class** *darc.sites.tel.Tel*

Bases: *darc.sites.\_abc.BaseSite*

Telephone numbers.

**static crawler** (*session, link*)

Crawler hook for telephone numbers.

**Parameters**

- **session** (*requests.Session*) – Session object with proxy settings.
- **link** (*darc.link.Link*) – Link object to be crawled.

**Raises** *LinkNoReturn* – This link has no return response.

**Return type** NoReturn

**static loader** (*driver, link*)

Not implemented.

**Raises** *LinkNoReturn* – This hook is not implemented.

**Parameters**

- **driver** (*selenium.webdriver.chrome.webdriver.WebDriver*) –
- **link** (*darc.link.Link*) –

**Return type** NoReturn

To start with, you just need to define your sites customisation by inheriting *BaseSite* and overload corresponding *crawler()* and/or *loader()* methods.

To customise behaviours over *requests*, you sites customisation class should have a *crawler()* method, e.g. *DefaultSite.crawler*.

The function takes the *requests.Session* object with proxy settings and a *Link* object representing the link to be crawled, then returns a *requests.Response* object containing the final data of the crawling process.

*darc.sites.crawler\_hook* (*link, session*)

Customisation as to *requests* sessions.

**Parameters**

- **link** (*darc.link.Link*) – Link object to be crawled.
- **session** (*requests.Session*) – Session object with proxy settings.

**Returns** The final response object with crawled data.

**Return type** *requests.Response*

See also:

- `darc.sites.SITE_MAP`
- `darc.sites._get_site()`
- `darc.crawl.crawler()`

To customise behaviours over selenium, you sites customisation class should have a `loader()` method, e.g. `DefaultSite.loader`.

The function takes the `WebDriver` object with proxy settings and a `Link` object representing the link to be loaded, then returns the `WebDriver` object containing the final data of the loading process.

`darc.sites.loader_hook(link, driver)`  
Customisation as to selenium drivers.

**Parameters**

- **link** (`darc.link.Link`) – Link object to be loaded.
- **driver** (`selenium.webdriver.Chrome`) – Web driver object with proxy settings.

**Returns** The web driver object with loaded data.

**Return type** `selenium.webdriver.Chrome`

**See also:**

- `darc.sites.SITE_MAP`
- `darc.sites._get_site()`
- `darc.crawl.loader()`

To tell the `darc` project which sites customisation module it should use for a certain hostname, you can register such module to the `SITEMAP` mapping dictionary through `register()`:

`darc.sites.register(site, *hostname)`  
Register new site map.

**Parameters**

- **site** (`Type[darc.sites._abc.BaseSite]`) – Sites customisation class inherited from `BaseSite`.
- **\*hostname** (`Tuple[str]`) – Optional list of hostnames the sites customisation should be registered with. By default, we use `site.hostname`.

**Return type** `None`

`darc.sites.SITEMAP: DefaultDict[str, Type[darc.sites._abc.BaseSite]]`

```
from darc.sites.default import DefaultSite

SITEMAP = collections.defaultdict(lambda: DefaultSite, {
    # 'www.sample.com': SampleSite, # local customised class
})
```

The mapping dictionary for hostname to sites customisation classes.

The fallback value is `darc.sites.default.DefaultSite`.

`darc.sites._get_site(link)`

Load sites customisation if any.

If the sites customisation does not exist, it will fallback to the default hooks, *DefaultSite*.

**Parameters** `link` (`darc.link.Link`) – Link object to fetch sites customisation class.

**Returns** The sites customisation class.

**Return type** `Type[darc.sites._abc.BaseSite]`

**See also:**

- `darc.sites.SITEMAP`

**See also:**

Please refer to *Customisations* for more examples and explanations.

## 2.12 Module Constants

### 2.12.1 Auxiliary Function

`darc.const.getpid()`

Get process ID.

The process ID will be saved under the *PATH\_DB* folder, in a file named `darc.pid`. If no such file exists, `-1` will be returned.

**Returns** The process ID.

**Return type** `int`

**See also:**

- `darc.const.PATH_ID`

`darc.const.get_lock()`

Get a lock.

**Returns** Lock context based on *FLAG\_MP* and *FLAG\_TH*.

**Return type** `Union[multiprocessing.context.BaseContext.Lock, _thread.allocate_lock, contextlib.nullcontext]`

### 2.12.2 General Configurations

`darc.const.REBOOT: bool`

If exit the program after first round, i.e. crawled all links from the *requests* link database and loaded all links from the *selenium* link database.

This can be useful especially when the capacity is limited and you wish to save some space before continuing next round. See *Docker integration* for more information.

**Default** `False`

**Environ** `DARC_REBOOT`

`darc.const.DEBUG: bool`

If run the program in debugging mode.

**Default** `False`

**Environ** `DARC_DEBUG`

`darc.const.VERBOSE: bool`

If run the program in verbose mode. If `DEBUG` is `True`, then the verbose mode will be always enabled.

**Default** `False`

**Environ** `DARC_VERBOSE`

`darc.const.FORCE: bool`

If ignore `robots.txt` rules when crawling (c.f. `crawler()`).

**Default** `False`

**Environ** `DARC_FORCE`

`darc.const.CHECK: bool`

If check proxy and hostname before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

If `CHECK_NG` is `True`, then this environment variable will be always set as `True`.

**Default** `False`

**Environ** `DARC_CHECK`

`darc.const.CHECK_NG: bool`

If check content type through HEAD requests before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

**Default** `False`

**Environ** `DARC_CHECK_CONTENT_TYPE`

`darc.const.ROOT: str`

The root folder of the project.

`darc.const.CWD = '.'`

The current working direcorey.

`darc.const.DARC_CPU: int`

Number of concurrent processes. If not provided, then the number of system CPUs will be used.

**Default** `None`

**Environ** `DARC_CPU`

`darc.const.FLAG_MP: bool`

If enable *multiprocessing* support.

**Default** `True`

**Environ** `DARC_MULTIPROCESSING`

`darc.const.FLAG_TH: bool`

If enable *multithreading* support.

**Default** `False`

**Environ** `DARC_MULTITHREADING`

---

**Note:** `FLAG_MP` and `FLAG_TH` can **NOT** be toggled at the same time.

---

`darc.const.DARC_USER: str`

*Non-root* user for proxies.

**Default** current login user (c.f. `getpass.getuser()`)

**Environ** `DARC_USER`

### 2.12.3 Data Storage

**See also:**

See `darc.db` for more information about database integration.

`darc.const.REDIS: redis.Redis`

URL to the Redis database.

**Default** `redis://127.0.0.1`

**Environ** `REDIS_URL`

`darc.const.DB: peewee.Database`

URL to the RDS storage.

**Default** `sqlite://{PATH_DB}/darc.db`

**Environ** `:envvar`DB_URL``

`darc.const.DB: peewee.Database`

URL to the data submission storage.

**Default** `sqlite://{PATH_DB}/darcweb.db`

**Environ** `:envvar`DB_URL``

`darc.const.FLAG_DB: bool`

Flag if uses RDS as the task queue backend. If `REDIS_URL` is provided, then `False`; else, `True`.

`darc.const.PATH_DB: str`

Path to data storage.

**Default** `data`

**Environ** `PATH_DATA`

**See also:**

See `darc.save` for more information about source saving.

`darc.const.PATH_MISC = '{PATH_DB}/misc/'`

Path to miscellaneous data storage, i.e. `misc` folder under the root of data storage.

**See also:**

- `darc.const.PATH_DB`

`darc.const.PATH_LN = '{PATH_DB}/link.csv'`

Path to the link CSV file, `link.csv`.

**See also:**

- `darc.const.PATH_DB`
- `darc.save.save_link`

`darc.const.PATH_ID = '{PATH_DB}/darc.pid'`  
Path to the process ID file, `darc.pid`.

See also:

- `darc.const.PATH_DB`
- `darc.const.getpid()`

## 2.12.4 Web Crawlers

`darc.const.DARC_WAIT: Optional[float]`

Time interval between each round when the `requests` and/or `selenium` database are empty.

**Default** 60

**Environ** `DARC_WAIT`

`darc.const.TIME_CACHE: float`

Time delta for caches in seconds.

The `darc` project supports *caching* for fetched files. `TIME_CACHE` will specify for how long the fetched files will be cached and **NOT** fetched again.

---

**Note:** If `TIME_CACHE` is `None` then caching will be marked as *forever*.

---

**Default** 60

**Environ** `TIME_CACHE`

`darc.const.SE_WAIT: float`

Time to wait for `selenium` to finish loading pages.

---

**Note:** Internally, `selenium` will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

---

**Default** 60

**Environ** `SE_WAIT`

`darc.const.SE_EMPTY = '<html><head></head><body></body></html>'`

The empty page from `selenium`.

See also:

- `darc.crawl.loader()`

### 2.12.5 White / Black Lists

`darc.const.LINK_WHITE_LIST: List[re.Pattern]`  
 White list of hostnames should be crawled.

**Default** []

**Environ** `LINK_WHITE_LIST`

---

**Note:** Regular expressions are supported.

---

`darc.const.LINK_BLACK_LIST: List[re.Pattern]`  
 Black list of hostnames should be crawled.

**Default** []

**Environ** `LINK_BLACK_LIST`

---

**Note:** Regular expressions are supported.

---

`darc.const.LINK_FALLBACK: bool`  
 Fallback value for `match_host()`.

**Default** `False`

**Environ** `LINK_FALLBACK`

`darc.const.MIME_WHITE_LIST: List[re.Pattern]`  
 White list of content types should be crawled.

**Default** []

**Environ** `MIME_WHITE_LIST`

---

**Note:** Regular expressions are supported.

---

`darc.const.MIME_BLACK_LIST: List[re.Pattern]`  
 Black list of content types should be crawled.

**Default** []

**Environ** `MIME_BLACK_LIST`

---

**Note:** Regular expressions are supported.

---

`darc.const.MIME_FALLBACK: bool`  
 Fallback value for `match_mime()`.

**Default** `False`

**Environ** `MIME_FALLBACK`

`darc.const.PROXY_WHITE_LIST: List[str]`  
 White list of proxy types should be crawled.

**Default** []

**Environ** `PROXY_WHITE_LIST`

---

**Note:** The proxy types are **case insensitive**.

---

`darc.const.PROXY_BLACK_LIST: List[str]`  
Black list of proxy types should be crawled.

**Default** []

**Environ** `PROXY_BLACK_LIST`

---

**Note:** The proxy types are **case insensitive**.

---

`darc.const.PROXY_FALLBACK: bool`  
Fallback value for `match_proxy()`.

**Default** `False`

**Environ** `PROXY_FALLBACK`

## 2.13 Custom Exceptions

The `render_error()` function can be used to render multi-line error messages with `stem.util.term` colours.

The `darc` project provides following custom exceptions:

- `LinkNoReturn`
- `UnsupportedLink`
- `UnsupportedPlatform`
- `UnsupportedProxy`
- `WorkerBreak`

---

**Note:** All exceptions are inherited from `_BaseException`.

---

The `darc` project provides following custom warnings:

- `TorBootstrapFailed`
- `I2PBootstrapFailed`
- `ZeroNetBootstrapFailed`
- `FreenetBootstrapFailed`
- `APIRequestFailed`
- `SiteNotFoundWarning`
- `LockWarning`
- `TorRenewFailed`
- `RedisCommandFailed`
- `HookExecutionFailed`

---

**Note:** All warnings are inherited from `_BaseWarning`.

---

**exception** `darc.error.APIRequestFailed`

Bases: `darc.error._BaseWarning`

API submit failed.

**exception** `darc.error.DatabaseOperationFailed`

Bases: `darc.error._BaseWarning`

Database operation execution failed.

**exception** `darc.error.FreenetBootstrapFailed`

Bases: `darc.error._BaseWarning`

Freenet bootstrap process failed.

**exception** `darc.error.HookExecutionFailed`

Bases: `darc.error._BaseWarning`

Failed to execute hook function.

**exception** `darc.error.I2PBootstrapFailed`

Bases: `darc.error._BaseWarning`

I2P bootstrap process failed.

**exception** `darc.error.LinkNoReturn` (`link=None, *, drop=True`)

Bases: `darc.error._BaseException`

The link has no return value from the hooks.

#### Parameters

- **link** (`darc.link.Link`) – Original link object.
- **drop** (`bool`) –

**Keyword Arguments** **drop** – If drops the link from task queues.

**Return type** `None`

**\_\_init\_\_** (`link=None, *, drop=True`)

Initialize self. See help(type(self)) for accurate signature.

**Parameters** **drop** (`bool`) –

**Return type** `None`

**exception** `darc.error.LockWarning`

Bases: `darc.error._BaseWarning`

Failed to acquire Redis lock.

**exception** `darc.error.RedisCommandFailed`

Bases: `darc.error._BaseWarning`

Redis command execution failed.

**exception** `darc.error.SiteNotFoundWarning`

Bases: `darc.error._BaseWarning`, `ImportWarning`

Site customisation not found.

**exception** `darc.error.TorBootstrapFailed`

Bases: `darc.error._BaseWarning`

Tor bootstrap process failed.

**exception** `darc.error.TorRenewFailed`

Bases: `darc.error._BaseWarning`

Tor renew request failed.

**exception** `darc.error.UnsupportedLink`

Bases: `darc.error._BaseException`

The link is not supported.

**exception** `darc.error.UnsupportedPlatform`

Bases: `darc.error._BaseException`

The platform is not supported.

**exception** `darc.error.UnsupportedProxy`

Bases: `darc.error._BaseException`

The proxy is not supported.

**exception** `darc.error.WorkerBreak`

Bases: `darc.error._BaseException`

Break from the worker loop.

**exception** `darc.error.ZeroNetBootstrapFailed`

Bases: `darc.error._BaseWarning`

ZeroNet bootstrap process failed.

**exception** `darc.error._BaseException`

Bases: `Exception`

Base exception class for `darc` module.

**exception** `darc.error._BaseWarning`

Bases: `Warning`

Base warning for `darc` module.

`darc.error.render_error` (*message*, *colour*)

Render error message.

The function wraps the `stem.util.term.format()` function to provide multi-line formatting support.

**Parameters**

- **message** (*AnyStr*) – Multi-line message to be rendered with `colour`.
- **colour** (*stem.util.term.Color*) – Front colour of text, c.f. `stem.util.term.Color`.

**Returns** The rendered error message.

**Return type** `str`

## 2.14 Data Models

The `darc.model` module contains all data models defined for the `darc` project, including RDS-based task queue and data submission.

### 2.14.1 Task Queues

The `darc.model.tasks` module defines the data models required for the task queue of `darc`.

See also:

Please refer to `darc.db` module for more information about the task queues.

#### Hostname Queue

---

**Important:** The hostname queue is a **set** named `queue_hostname` in a **Redis** based task queue.

---

The `darc.model.tasks.hostname` model contains the data model defined for the hostname queue.

```
class darc.model.tasks.hostname.HostnameQueueModel (*args, **kwargs)
    Bases: darc.model.abc.BaseModel

    Hostname task queue.

    DoesNotExist
        alias of HostnameQueueModelDoesNotExist

    hostname: Union[str, peewee.TextField] = <TextField: HostnameQueueModel.hostname>
        Hostname (c.f. link.host).

    id = <AutoField: HostnameQueueModel.id>

    timestamp: Union[datetime.datetime, peewee.DateTimeField] = <DateTimeField: HostnameQueueModel.timestamp>
        Timestamp of last update.
```

#### Crawler Queue

---

**Important:** The `crawler` queue is a **sorted set** named `queue_requests` in a **Redis** based task queue.

---

The `darc.model.tasks.requests` model contains the data model defined for the `crawler` queue.

```
class darc.model.tasks.requests.RequestsQueueModel (*args, **kwargs)
    Bases: darc.model.abc.BaseModel

    Task queue for crawler().

    DoesNotExist
        alias of RequestsQueueModelDoesNotExist

    hash: Union[str, peewee.CharField] = <CharField: RequestsQueueModel.hash>
        Sha256 hash value (c.f. Link.name).

    id = <AutoField: RequestsQueueModel.id>
```

```
link: Union[darc.link.Link, darc.model.utils.PickleField] = <PickleField: RequestsQueueModel.link>
    Pickled target Link instance.

text: Union[str, peewee.TextField] = <TextField: RequestsQueueModel.text>
    URL as raw text (c.f. Link.url).

timestamp: Union[datetime.datetime, peewee.DateTimeField] = <DateTimeField: RequestsQueueModel.timestamp>
    Timestamp of last update.
```

## Loader Queue

---

**Important:** The *loader* queue is a **sorted set** named `queue_selenium` in a *Redis* based task queue.

---

The *darc.model.tasks.selenium* model contains the data model defined for the *loader* queue.

```
class darc.model.tasks.selenium.SeleniumQueueModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModel

    Task queue for loader().

    DoesNotExist
        alias of SeleniumQueueModelDoesNotExist

    hash: Union[str, peewee.CharField] = <CharField: SeleniumQueueModel.hash>
        Sha256 hash value (c.f. Link.name).

    id = <AutoField: SeleniumQueueModel.id>

    link: Union[darc.link.Link, darc.model.utils.PickleField] = <PickleField: SeleniumQueueModel.link>
        Pickled target Link instance.

    text: Union[str, peewee.TextField] = <TextField: SeleniumQueueModel.text>
        URL as raw text (c.f. Link.url).

    timestamp: Union[datetime.datetime, peewee.DateTimeField] = <DateTimeField: SeleniumQueueModel.timestamp>
        Timestamp of last update.
```

## 2.14.2 Submission Data Models

The *darc.model.web* module defines the data models to store the data crawled from the *darc* project.

**See also:**

Please refer to *darc.submit* module for more information about data submission.

### Hostname Records

The *darc.model.web.hostname* module defines the data model representing hostnames, specifically from `new_host` submission.

**See also:**

Please refer to *darc.submit.submit\_new\_host()* for more information.

```
class darc.model.web.hostname.HostnameModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for a hostname record.
```

---

**Important:** The *alive* of a hostname is toggled if `crawler()` successfully requested a URL with such hostname.

---

**DoesNotExist**alias of `HostnameModelDoesNotExist`**property alive**

If the hostname is still active.

We consider the hostname as *inactive*, only if all subsidiary URLs are *inactive*.**discovery:** `datetime.datetime` = `<DateTimeField: HostnameModel.discovery>`Timestamp of first `new_host` submission.**hostname:** `str` = `<TextField: HostnameModel.hostname>`Hostname (c.f. `link.host`).**hosts****id** = `<AutoField: HostnameModel.id>`**last\_seen:** `datetime.datetime` = `<DateTimeField: HostnameModel.last_seen>`

Timestamp of last related submission.

**proxy:** `darc.model.utils.Proxy` = `<IntEnumField: HostnameModel.proxy>`Proxy type (c.f. `link.proxy`).**robots****property since**

The hostname is active/inactive since such timestamp.

We consider the timestamp by the earliest timestamp of related subsidiary *active/inactive* URLs.**sitemaps****urls**

## URL Records

The `darc.model.web.url` module defines the data model representing URLs, specifically from requests and selenium submission.

**See also:**

Please refer to `darc.submit.submit_requests()` and `darc.submit.submit_selenium()` for more information.

**class** `darc.model.web.url.URLModel(*args, **kwargs)`Bases: `darc.model.abc.BaseModelWeb`

Data model for a requested URL.

---

**Important:** The *alive* of a URL is toggled if `crawler()` successfully requested such URL and the status code is ok.

---

**DoesNotExist**alias of `URLModelDoesNotExist`

```
alive: bool = <BooleanField: URLModel.alive>
    If the hostname is still active.

discovery: datetime.datetime = <DateTimeField: URLModel.discovery>
    Timestamp of first submission.

hash: str = <CharField: URLModel.hash>
    Sha256 hash value (c.f. Link.name).

hostname: darc.model.web.hostname.HostnameModel = <ForeignKeyField: URLModel.hostname>
    Hostname (c.f. link.host).

hostname_id = <ForeignKeyField: URLModel.hostname>

id = <AutoField: URLModel.id>

last_seen: datetime.datetime = <DateTimeField: URLModel.last_seen>
    Timestamp of last submission.

proxy: darc.model.utils.Proxy = <IntEnumField: URLModel.proxy>
    Proxy type (c.f. link.proxy).

requests

selenium

since: datetime.datetime = <DateTimeField: URLModel.since>
    The hostname is active/inactive since this timestamp.

url: str = <TextField: URLModel.url>
    Original URL (c.f. link.url).
```

### robots.txt Records

The *darc.model.web.robots* module defines the data model representing *robots.txt* data, specifically from *new\_host* submission.

See also:

Please refer to *darc.submit.submit\_new\_host()* for more information.

```
class darc.model.web.robots.RobotsModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for robots.txt data.

    DoesNotExist
        alias of RobotsModelDoesNotExist

    document: str = <TextField: RobotsModel.document>
        Document data as str.

    host: darc.model.web.hostname.HostnameModel = <ForeignKeyField: RobotsModel.host>
        Hostname (c.f. link.host).

    host_id = <ForeignKeyField: RobotsModel.host>

    id = <AutoField: RobotsModel.id>

    timestamp: datetime.datetime = <DateTimeField: RobotsModel.timestamp>
        Timestamp of the submission.
```

## sitemap.xml Records

The `darc.model.web.sitemap` module defines the data model representing `sitemap.xml` data, specifically from `new_host` submission.

See also:

Please refer to `darc.submit.submit_new_host()` for more information.

```
class darc.model.web.sitemap.SitemapModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for sitemap.xml data.

    DoesNotExist
        alias of SitemapModelDoesNotExist

    document: str = <TextField: SitemapModel.document>
        Document data as str.

    host: darc.model.web.hostname.HostnameModel = <ForeignKeyField: SitemapModel.host>
        Hostname (c.f. link.host).

    host_id = <ForeignKeyField: SitemapModel.host>

    id = <AutoField: SitemapModel.id>

    timestamp: datetime.datetime = <DateTimeField: SitemapModel.timestamp>
        Timestamp of the submission.
```

## hosts.txt Records

The `darc.model.web.hosts` module defines the data model representing `hosts.txt` data, specifically from `new_host` submission.

See also:

Please refer to `darc.submit.submit_new_host()` for more information.

```
class darc.model.web.hosts.HostsModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for hosts.txt data.

    DoesNotExist
        alias of HostsModelDoesNotExist

    document: str = <TextField: HostsModel.document>
        Document data as str.

    host: darc.model.web.hostname.HostnameModel = <ForeignKeyField: HostsModel.host>
        Hostname (c.f. link.host).

    host_id = <ForeignKeyField: HostsModel.host>

    id = <AutoField: HostsModel.id>

    timestamp: datetime.datetime = <DateTimeField: HostsModel.timestamp>
        Timestamp of the submission.
```

## Crawler Records

The `darc.model.web.requests` module defines the data model representing *crawler*, specifically from requests submission.

See also:

Please refer to `darc.submit.submit_requests()` for more information.

```
class darc.model.web.requests.RequestsHistoryModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for history records from requests submission.

    DoesNotExist
        alias of RequestsHistoryModelDoesNotExist

    cookies: List[Dict[str, Any]] = <JSONField: RequestsHistoryModel.cookies>
        Response cookies.

    document: bytes = <BlobField: RequestsHistoryModel.document>
        Document data as bytes.

    id = <AutoField: RequestsHistoryModel.id>

    index: int = <IntegerField: RequestsHistoryModel.index>
        History index number.

    method: str = <CharField: RequestsHistoryModel.method>
        Request method (normally GET).

    model: darc.model.web.requests.RequestsModel = <ForeignKeyField: RequestsHistoryModel.model>
        Original record.

    model_id = <ForeignKeyField: RequestsHistoryModel.model>

    reason: str = <TextField: RequestsHistoryModel.reason>
        Response reason string.

    request: Dict[str, str] = <JSONField: RequestsHistoryModel.request>
        Request headers.

    response: Dict[str, str] = <JSONField: RequestsHistoryModel.response>
        Response headers.

    status_code: int = <IntegerField: RequestsHistoryModel.status_code>
        Status code.

    timestamp: datetime.datetime = <DateTimeField: RequestsHistoryModel.timestamp>
        Timestamp of the submission.

    url: str = <TextField: RequestsHistoryModel.url>
        Request URL.

class darc.model.web.requests.RequestsModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

    Data model for documents from requests submission.

    DoesNotExist
        alias of RequestsModelDoesNotExist

    cookies: List[Dict[str, Any]] = <JSONField: RequestsModel.cookies>
        Response cookies.
```

```

document: bytes = <BlobField: RequestsModel.document>
    Document data as bytes.

history

id = <AutoField: RequestsModel.id>

is_html: bool = <BooleanField: RequestsModel.is_html>
    If document is HTML or miscellaneous data.

method: str = <CharField: RequestsModel.method>
    Request method (normally GET).

mime_type: str = <CharField: RequestsModel.mime_type>
    Content type.

reason: str = <TextField: RequestsModel.reason>
    Response reason string.

request: Dict[str, str] = <JSONField: RequestsModel.request>
    Request headers.

response: Dict[str, str] = <JSONField: RequestsModel.response>
    Response headers.

session: List[Dict[str, Any]] = <JSONField: RequestsModel.session>
    Session cookies.

status_code: int = <IntegerField: RequestsModel.status_code>
    Status code.

timestamp: datetime.datetime = <DateTimeField: RequestsModel.timestamp>
    Timestamp of the submission.

url: darc.model.web.url.URLModel = <ForeignKeyField: RequestsModel.url>
    Original URL (c.f. link.url).

url_id = <ForeignKeyField: RequestsModel.url>

```

## Loader Records

The *darc.model.web.selenium* module defines the data model representing *loader*, specifically from selenium submission.

### See also:

Please refer to *darc.submit.submit\_selenium()* for more information.

```

class darc.model.web.selenium.SeleniumModel(*args, **kwargs)
    Bases: darc.model.abc.BaseModelWeb

```

Data model for documents from selenium submission.

### DoesNotExist

alias of SeleniumModelDoesNotExist

```

document: str = <TextField: SeleniumModel.document>
    Document data as str.

```

```

id = <AutoField: SeleniumModel.id>

```

```

screenshot: Optional[bytes] = <BlobField: SeleniumModel.screenshot>
    Screenshot in PNG format as bytes.

```

```
timestamp: datetime.datetime = <DateTimeField: SeleniumModel.timestamp>
    Timestamp of the submission.

url: darc.model.web.url.URLModel = <ForeignKeyField: SeleniumModel.url>
    Original URL (c.f. link.url).

url_id = <ForeignKeyField: SeleniumModel.url>
```

### 2.14.3 Base Model

The `darc.model.abc` module contains abstract base class of all data models for the `darc` project.

```
class darc.model.abc.BaseMeta
    Bases: object

    Basic metadata for data models.

    table_function()
        Generate table name dynamically (c.f. table_function()).

        Parameters model_class (peewee.Model) –
        Return type str

    database = <peewee.SqliteDatabase object>
        Reference database storage (c.f. DB).

class darc.model.abc.BaseMetaWeb
    Bases: darc.model.abc.BaseMeta

    Basic metadata for data models of data submission.

    database = <peewee.SqliteDatabase object>
        Reference database storage (c.f. DB).

class darc.model.abc.BaseModel(*args, **kwargs)
    Bases: peewee.Model

    Base model with standard patterns.
```

---

#### Notes

The model will implicitly have a `AutoField` attribute named as `id`.

---

#### DoesNotExist

alias of `BaseModelDoesNotExist`

#### to\_dict(keep\_id=False)

Convert record to `dict`.

Parameters `keep_id` (`bool`) – If keep the ID auto field.

Returns The data converted through `playhouse.shortcuts.model_to_dict()`.

Return type `None`

#### Meta

Basic metadata for data models.

```
id = <AutoField: BaseModel.id>
```

```
class darc.model.abc.BaseModelWeb(*args, **kwargs)
```

Bases: *darc.model.abc.BaseModel*

Base model with standard patterns for data submission.

---

#### Notes

The model will implicitly have a `AutoField` attribute named as *id*.

---

#### DoesNotExist

alias of `BaseModelWebDoesNotExist`

#### Meta

Basic metadata for data models.

```
id = <AutoField: BaseModelWeb.id>
```

## 2.14.4 Miscellaneous Utilities

The *darc.model.utils* module contains several miscellaneous utility functions and data fields.

```
class darc.model.utils.IPField(null=False, index=False, unique=False, column_name=None,  
                               default=None, primary_key=False, constraints=None,  
                               sequence=None, collation=None, unindexed=False,  
                               choices=None, help_text=None, verbose_name=None, in-  
                               dex_type=None, db_column=None, _hidden=False)
```

Bases: `peewee.IPField`

IP data field.

**db\_value** (*val*)

Dump the value for database storage.

#### Parameters

- **value** – Source IP address instance.
- **val** (*Optional[Union[str, ipaddress.IPv4Address, ipaddress.IPv6Address]]*) –

**Returns** Integral representation of the IP address.

**Return type** `Optional[int]`

**python\_value** (*val*)

Load the value from database storage.

#### Parameters

- **value** – Integral representation of the IP address.
- **val** (*Optional[int]*) –

**Returns** Original IP address instance.

**Return type** `Optional[Union[ipaddress.IPv4Address, ipaddress.IPv6Address]]`

```
class darc.model.utils.IntEnumField(null=False, index=False, unique=False, column_name=None, default=None, primary_key=False, constraints=None, sequence=None, collation=None, unindexed=False, choices=None, help_text=None, verbose_name=None, index_type=None, db_column=None, _hidden=False)
```

Bases: `peewee.IntegerField`

`enum.IntEnum` data field.

**python\_value** (*value*)

Load the value from database storage.

**Parameters** *value* (*Optional[int]*) – Integral representation of the enumeration.

**Returns** Original enumeration object.

**Return type** `Optional[enum.IntEnum]`

**choices:** `enum.IntEnum`

The original `enum.IntEnum` class.

```
class darc.model.utils.JSONField(null=False, index=False, unique=False, column_name=None, default=None, primary_key=False, constraints=None, sequence=None, collation=None, unindexed=False, choices=None, help_text=None, verbose_name=None, index_type=None, db_column=None, _hidden=False)
```

Bases: `playhouse.mysql_ext.JSONField`

JSON data field.

**db\_value** (*value*)

Dump the value for database storage.

**Parameters** *value* (*Any*) – Source JSON value.

**Returns** JSON serialised string data.

**Return type** `Optional[str]`

**python\_value** (*value*)

Load the value from database storage.

**Parameters** *value* (*Optional[str]*) – Serialised JSON string.

**Returns** Original JSON data.

**Return type** `Any`

```
class darc.model.utils.PickleField(null=False, index=False, unique=False, column_name=None, default=None, primary_key=False, constraints=None, sequence=None, collation=None, unindexed=False, choices=None, help_text=None, verbose_name=None, index_type=None, db_column=None, _hidden=False)
```

Bases: `peewee.BlobField`

Pickled data field.

**db\_value** (*value*)

Dump the value for database storage.

**Parameters** *value* (*Any*) – Source value.

**Returns** Picked bytestring data.

**Return type** `Optional[bytes]`

**python\_value** (*value*)

Load the value from database storage.

**Parameters** *value* (`Optional[bytes]`) – SPicked bytestring data.

**Returns** Original data.

**Return type** Any

**class** `darc.model.utils.Proxy` (*value*)

Bases: `enum.IntEnum`

Proxy types supported by *darc*.

**FREENET** = 5

Freenet proxy.

**I2P** = 3

I2P proxy.

**NULL** = 1

No proxy.

**TOR** = 2

Tor proxy.

**TOR2WEB** = 6

//onion.sh/>`\_\_, no proxy).

**Type** Proxied Tor (`tor2web <https`

**ZERONET** = 4

ZeroNet proxy.

`darc.model.utils.table_function` (*model\_class*)

Generate table name dynamically.

The function strips `Model` from the class name and calls `peewee.make_snake_case()` to generate a proper table name.

**Parameters** *model\_class* (`peewee.Model`) – Data model class.

**Returns** Generated table name.

**Return type** `str`

As the websites can be sometimes irritating for their anti-robots verification, login requirements, etc., the *darc* project also provides hooks to customise crawling behaviours around both `requests` and `selenium`.

#### See also:

Such customisation, as called in the *darc* project, site hooks, is site specific, user can set up your own hooks unto a certain site, c.f. *darc.sites* for more information.

Still, since the network is a world full of mysteries and miracles, the speed of crawling will much depend on the response speed of the target website. To boost up, as well as meet the system capacity, the *darc* project introduced multiprocessing, multithreading and the fallback slowest single-threaded solutions when crawling.

---

**Note:** When rendering the target website using `selenium` powered by the renown Google Chrome, it will require much memory to run. Thus, the three solutions mentioned above would only toggle the behaviour around the use of

selenium.

---

To keep the *darc* project as it is a swiss army knife, only the main entrypoint function *darc.process.process()* is exported in global namespace (and renamed to *darc.darc()*), see below:

*darc.darc(worker)*

Main process.

The function will register *\_signal\_handler()* for SIGTERM, and start the main process of the *darc* darkweb crawlers.

**Parameters** *worker* (*Literal[crawler, loader]*) – Worker process type.

**Raises** *ValueError* – If *worker* is not a valid value.

**Return type** *None*

Before starting the workers, the function will start proxies through

- *darc.proxy.tor.tor\_proxy()*
- *darc.proxy.i2p.i2p\_proxy()*
- *darc.proxy.zeronet.zeronet\_proxy()*
- *darc.proxy.freenet.freenet\_proxy()*

The general process can be described as following for *workers* of crawler type:

1. *process\_crawler()*: obtain URLs from the *requests* link database (c.f. *load\_requests()*), and feed such URLs to *crawler()*.

---

**Note:** If *FLAG\_MP* is *True*, the function will be called with *multiprocessing* support; if *FLAG\_TH* if *True*, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

---

2. *crawler()*: parse the URL using *parse\_link()*, and check if need to crawl the URL (c.f. *PROXY\_WHITE\_LIST*, *PROXY\_BLACK\_LIST*, *LINK\_WHITE\_LIST* and *LINK\_BLACK\_LIST*); if true, then crawl the URL with *requests*.

If the URL is from a brand new host, *darc* will first try to fetch and save *robots.txt* and sitemaps of the host (c.f. *save\_robots()* and *save\_sitemap()*), and extract then save the links from sitemaps (c.f. *read\_sitemap()*) into link database for future crawling (c.f. *save\_requests()*). Also, if the submission API is provided, *submit\_new\_host()* will be called and submit the documents just fetched.

If *robots.txt* presented, and *FORCE* is *False*, *darc* will check if allowed to crawl the URL.

---

**Note:** The root path (e.g. / in <https://www.example.com/>) will always be crawled ignoring *robots.txt*.

---

At this point, *darc* will call the customised hook function from *darc.sites* to crawl and get the final response object. *darc* will save the session cookies and header information, using *save\_headers()*.

---

**Note:** If *requests.exceptions.InvalidSchema* is raised, the link will be saved by *save\_invalid()*. Further processing is dropped.

---

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (text/html and application/xhtml+xml), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If **NOT**, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for *workers* of loader type:

1. `process_loader()`: in the meanwhile, *darc* will obtain URLs from the selenium link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

---

**Note:** If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

---

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, *darc* will call the customised hook function from `darc.sites` to load and return the original Chrome object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

After each *round*, *darc* will call registered hook functions in sequential order, with the type of worker ('crawler' or 'loader') and the current link pool as its parameters, see `register()` for more information.

If in reboot mode, i.e. `REBOOT` is `True`, the function will exit after first round. If not, it will renew the Tor connections (if bootstrapped), c.f. `renew_tor_session()`, and start another round.

**See also:**

The function is renamed from `darc.process.process()`.

And we also exported the necessary hook registration functions to the global namespace, see below:

`darc.register_hooks(hook, *, _index=None)`

Register hook function.

#### Parameters

- **hook** (Callable[[Literal[crawler, loader], List[darc.link.Link]], None]) – Hook function to be registered.
- **\_index** (Optional[int]) –

**Keyword Arguments** `_index` – Position index for the hook function.

**Return type** `None`

The hook function takes two parameters:

1. a `str` object indicating the type of worker, i.e. 'crawler' or 'loader';
2. a `list` object containing `Link` objects, as the current processed link pool.

The hook function may raises `WorkerBreak` so that the worker shall break from its indefinite loop upon finishing of current *round*. Any value returned from the hook function will be ignored by the workers.

**See also:**

The hook functions will be saved into `_HOOK_REGISTRY`.

**See also:**

The function is renamed from `darc.process.register()`.

`darc.register_proxy(proxy, session=<function null_session>, driver=<function null_driver>)`

Register new proxy type.

**Parameters**

- **proxy** (`str`) – Proxy type.
- **session** (`Callable[[bool], requests.sessions.Session]`) – Session factory function, c.f. `darc.requests.null_session()`.
- **driver** (`Callable[[], selenium.webdriver.chrome.webdriver.WebDriver]`) – Driver factory function, c.f. `darc.selenium.null_driver()`.

**Return type** `None`

**See also:**

The function is renamed from `darc.proxy.register()`.

`darc.register_sites(site, *hostname)`

Register new site map.

**Parameters**

- **site** (`Type[darc.sites._abc.BaseSite]`) – Sites customisation class inherited from `BaseSite`.
- **\*hostname** (`Tuple[str]`) – Optional list of hostnames the sites customisation should be registered with. By default, we use `site.hostname`.

**Return type** `None`

**See also:**

The function is renamed from `darc.sites.register()`.

For more information on the hooks, please refer to the *customisation* documentations.

## CONFIGURATION

The *darc* project is generally configurable through numerous environment variables. Below is the full list of supported environment variables you may use to configure the behaviour of *darc*.

### 3.1 General Configurations

#### DARC\_REBOOT

**Type** `bool(int)`

**Default** 0

If exit the program after first round, i.e. crawled all links from the `requests` link database and loaded all links from the `selenium` link database.

This can be useful especially when the capacity is limited and you wish to save some space before continuing next round. See *Docker integration* for more information.

#### DARC\_DEBUG

**Type** `bool(int)`

**Default** 0

If run the program in debugging mode.

#### DARC\_VERBOSE

**Type** `bool(int)`

**Default** 0

If run the program in verbose mode. If `DARC_DEBUG` is `True`, then the verbose mode will be always enabled.

#### DARC\_FORCE

**Type** `bool(int)`

**Default** 0

If ignore `robots.txt` rules when crawling (c.f. `crawler()`).

#### DARC\_CHECK

**Type** `bool(int)`

**Default** 0

If check proxy and hostname before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

If `DARC_CHECK_CONTENT_TYPE` is `True`, then this environment variable will be always set as `True`.

**DARC\_CHECK\_CONTENT\_TYPE**

**Type** `bool(int)`

**Default** `0`

If check content type through HEAD requests before crawling (when calling `extract_links()`, `read_sitemap()` and `read_hosts()`).

**DARC\_URL\_PAT**

**Type** `List[Tuple[str, int]]` (JSON)

**Default** `[]`

Regular expression patterns to match all reasonable URLs.

The environment variable should be **JSON** encoded, as an *array of two-element pairs*. In each pair, it contains one Python regular expression string (`str`) as described in the builtin `re` module and one numeric value (`int`) representing the flags as defined in the builtin `re` module as well.

---

**Important:** The patterns **must** have a named match group `url`, e.g. `(?P<url>bitcoin:\w+)` so that the function can extract matched URLs from the given pattern.

---

**DARC\_CPU**

**Type** `int`

**Default** `None`

Number of concurrent processes. If not provided, then the number of system CPUs will be used.

**DARC\_MULTIPROCESSING**

**Type** `bool(int)`

**Default** `1`

If enable *multiprocessing* support.

**DARC\_MULTITHREADING**

**Type** `bool(int)`

**Default** `0`

If enable *multithreading* support.

---

**Note:** `DARC_MULTIPROCESSING` and `DARC_MULTITHREADING` can **NOT** be toggled at the same time.

---

**DARC\_USER**

**Type** `str`

**Default** current login user (c.f. `getpass.getuser()`)

*Non-root* user for proxies.

## 3.2 Data Storage

**See also:**

See `darc.save` for more information about source saving.

See `darc.db` for more information about database integration.

### PATH\_DATA

**Type** `str` (path)

**Default** `data`

Path to data storage.

### REDIS\_URL

**Type** `str` (url)

**Default** `redis://127.0.0.1`

URL to the Redis database.

### DB\_URL

**Type** `str` (url)

URL to the RDS storage.

---

**Important:** The task queues will be saved to `darc` database; the data submittsion will be saved to `darcweb` database.

Thus, when providing this environment variable, please do **NOT** specify the database name.

---

### DARC\_BULK\_SIZE

**Type** `int`

**Default** `100`

*Bulk* size for updating databases.

**See also:**

- `darc.db.save_requests()`
- `darc.db.save_selenium()`

### LOCK\_TIMEOUT

**Type** `float`

**Default** `10`

Lock blocking timeout.

---

**Note:** If is an infinit `inf`, no timeout will be applied.

---

**See also:**

Get a lock from `darc.db.get_lock()`.

#### DARC\_MAX\_POOL

**Type** `int`

**Default** `1_000`

Maximum number of links loaded from the database.

---

**Note:** If is an infinit `inf`, no limit will be applied.

---

**See also:**

- `darc.db.load_requests()`
- `darc.db.load_selenium()`

#### REDIS\_LOCK

**Type** `bool(int)`

**Default** `0`

If use Redis (Lua) lock to ensure process/thread-safely operations.

**See also:**

Toggles the behaviour of `darc.db.get_lock()`.

#### RETRY\_INTERVAL

**Type** `int`

**Default** `10`

Retry interval between each Redis command failure.

---

**Note:** If is an infinit `inf`, no interval will be applied.

---

**See also:**

Toggles the behaviour of `darc.db.redis_command()`.

## 3.3 Web Crawlers

#### DARC\_WAIT

**Type** `float`

**Default** `60`

Time interval between each round when the `requests` and/or `selenium` database are empty.

#### DARC\_SAVE

**Type** `bool(int)`

**Default** `0`

If save processed link back to database.

---

**Note:** If `DARC_SAVE` is `True`, then `DARC_SAVE_REQUESTS` and `DARC_SAVE_SELENIUM` will be forced to be `True`.

---

**See also:**

See `darc.db` for more information about link database.

#### **DARC\_SAVE\_REQUESTS**

**Type** `bool(int)`

**Default** `0`

If save `crawler()` crawled link back to `requests` database.

**See also:**

See `darc.db` for more information about link database.

#### **DARC\_SAVE\_SELENIUM**

**Type** `bool(int)`

**Default** `0`

If save `loader()` crawled link back to `selenium` database.

**See also:**

See `darc.db` for more information about link database.

#### **TIME\_CACHE**

**Type** `float`

**Default** `60`

Time delta for caches in seconds.

The `darc` project supports *caching* for fetched files. `TIME_CACHE` will specify for how long the fetched files will be cached and **NOT** fetched again.

---

**Note:** If `TIME_CACHE` is `None` then caching will be marked as *forever*.

---

#### **SE\_WAIT**

**Type** `float`

**Default** `60`

Time to wait for `selenium` to finish loading pages.

---

**Note:** Internally, `selenium` will wait for the browser to finish loading the pages before return (i.e. the web API event `DOMContentLoaded`). However, some extra scripts may take more time running after the event.

---

#### **CHROME\_BINARY\_LOCATION**

**Type** `str`

**Default** `google-chrome`

Path to the Google Chrome binary location.

---

**Note:** This environment variable is mandatory for non *macOS* and/or *Linux* systems.

---

**See also:**

See `darc.selenium` for more information.

## 3.4 White / Black Lists

### **LINK\_WHITE\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

White list of hostnames should be crawled.

---

**Note:** Regular expressions are supported.

---

### **LINK\_BLACK\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

Black list of hostnames should be crawled.

---

**Note:** Regular expressions are supported.

---

### **LINK\_FALLBACK**

**Type** `bool(int)`

**Default** `0`

Fallback value for `match_host()`.

### **MIME\_WHITE\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

White list of content types should be crawled.

---

**Note:** Regular expressions are supported.

---

### **MIME\_BLACK\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

Black list of content types should be crawled.

---

**Note:** Regular expressions are supported.

---

#### **MIME\_FALLBACK**

**Type** `bool(int)`

**Default** `0`

Fallback value for `match_mime()`.

#### **PROXY\_WHITE\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

White list of proxy types should be crawled.

---

**Note:** The proxy types are **case insensitive**.

---

#### **PROXY\_BLACK\_LIST**

**Type** `List[str]` (JSON)

**Default** `[]`

Black list of proxy types should be crawled.

---

**Note:** The proxy types are **case insensitive**.

---

#### **PROXY\_FALLBACK**

**Type** `bool(int)`

**Default** `0`

Fallback value for `match_proxy()`.

---

**Note:** If provided, `LINK_WHITE_LIST`, `LINK_BLACK_LIST`, `MIME_WHITE_LIST`, `MIME_BLACK_LIST`, `PROXY_WHITE_LIST` and `PROXY_BLACK_LIST` should all be JSON encoded strings.

---

## 3.5 Data Submission

#### **SAVE\_DB**

**Type** `bool`

**Default** `True`

Save submitted data to database.

#### **API\_RETRY**

**Type** `int`

**Default** 3

Retry times for API submission when failure.

**API\_NEW\_HOST**

**Type** `str`

**Default** `None`

API URL for `submit_new_host()`.

**API\_REQUESTS**

**Type** `str`

**Default** `None`

API URL for `submit_requests()`.

**API\_SELENIUM**

**Type** `str`

**Default** `None`

API URL for `submit_selenium()`.

---

**Note:** If `API_NEW_HOST`, `API_REQUESTS` and `API_SELENIUM` is `None`, the corresponding submit function will save the JSON data in the path specified by `PATH_DATA`.

---

## 3.6 Tor Proxy Configuration

**DARC\_TOR**

**Type** `bool(int)`

**Default** 1

If manage the Tor proxy through *darc*.

**TOR\_PORT**

**Type** `int`

**Default** 9050

Port for Tor proxy connection.

**TOR\_CTRL**

**Type** `int`

**Default** 9051

Port for Tor controller connection.

**TOR\_PASS**

**Type** `str`

**Default** `None`

Tor controller authentication token.

---

**Note:** If not provided, it will be requested at runtime.

---

#### TOR\_RETRY

**Type** `int`

**Default** 3

Retry times for Tor bootstrap when failure.

#### TOR\_WAIT

**Type** `float`

**Default** 90

Time after which the attempt to start Tor is aborted.

---

**Note:** If not provided, there will be **NO** timeouts.

---

#### TOR\_CFG

**Type** `Dict[str, Any]` (JSON)

**Default** {}

Tor bootstrap configuration for `stem.process.launch_tor_with_config()`.

---

**Note:** If provided, it should be a JSON encoded string.

---

## 3.7 I2P Proxy Configuration

#### DARC\_I2P

**Type** `bool(int)`

**Default** 1

If manage the I2P proxy through *darc*.

#### I2P\_PORT

**Type** `int`

**Default** 4444

Port for I2P proxy connection.

#### I2P\_RETRY

**Type** `int`

**Default** 3

Retry times for I2P bootstrap when failure.

#### I2P\_WAIT

**Type** `float`

**Default** 90

Time after which the attempt to start I2P is aborted.

---

**Note:** If not provided, there will be **NO** timeouts.

---

#### **I2P\_ARGS**

**Type** `str` (Shell)

**Default** ''

I2P bootstrap arguments for `i2prouter start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

---

**Note:** The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is *root*.

---

## 3.8 ZeroNet Proxy Configuration

#### **DARC\_ZERONET**

**Type** `bool(int)`

**Default** 1

If manage the ZeroNet proxy through *darc*.

#### **ZERONET\_PORT**

**Type** `int`

**Default** 4444

Port for ZeroNet proxy connection.

#### **ZERONET\_RETRY**

**Type** `int`

**Default** 3

Retry times for ZeroNet bootstrap when failure.

#### **ZERONET\_WAIT**

**Type** `float`

**Default** 90

Time after which the attempt to start ZeroNet is aborted.

---

**Note:** If not provided, there will be **NO** timeouts.

---

#### **ZERONET\_PATH**

**Type** `str` (path)

**Default** `/usr/local/src/zeronet`

Path to the ZeroNet project.

#### **ZERONET\_ARGS**

**Type** `str` (Shell)

**Default** `' '`

ZeroNet bootstrap arguments for `ZeroNet.sh main`.

---

**Note:** If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

---

## 3.9 Freenet Proxy Configuration

#### **DARC\_FREENET**

**Type** `bool(int)`

**Default** `1`

If manage the Freenet proxy through *darc*.

#### **FREENET\_PORT**

**Type** `int`

**Default** `8888`

Port for Freenet proxy connection.

#### **FREENET\_RETRY**

**Type** `int`

**Default** `3`

Retry times for Freenet bootstrap when failure.

#### **FREENET\_WAIT**

**Type** `float`

**Default** `90`

Time after which the attempt to start Freenet is aborted.

---

**Note:** If not provided, there will be **NO** timeouts.

---

#### **FREENET\_PATH**

**Type** `str` (path)

**Default** `/usr/local/src/freenet`

Path to the Freenet project.

#### **FREENET\_ARGS**

**Type** `str` (Shell)

**Default** `' '`

Freenet bootstrap arguments for `run.sh start`.

If provided, it should be parsed as command line arguments (c.f. `shlex.split()`).

---

**Note:** The command will be run as `DARC_USER`, if current user (c.f. `getpass.getuser()`) is *root*.

---

## CUSTOMISATIONS

Currently, *darcs* provides three major customisation points, besides the various *environment variables*.

### 4.1 Hooks between Rounds

See also:

See *darcs.process.register()* for technical information.

As the workers are defined as indefinite loops, we introduced the *hooks between rounds* to be called at end of each loop. Such hook functions can process all links that had been crawled and/or loaded in the past round, or to indicate the end of the indefinite loop, so that we can stop the workers in an elegant way.

A typical hook function can be defined as following:

```
from darcs.error import WorkerBreak
from darcs.process import register

def dummy_hook(node_type, link_pool):
    """A sample hook function that prints the processed links
    in the past round and informs the work to quit.

    Args:
        node_type (Literal['crawler', 'loader']): Type of worker node.
        link_pool (List[darcs.link.Link]): List of processed links.

    Returns:
        NoReturn: The hook function will never return, though return
        values will be ignored anyway.

    Raises:
        darcs.error.WorkerBreak: Inform the work to quit after this round.

    """
    if node_type == 'crawler':
        verb = 'crawled'
    elif node_type == 'loader':
        verb = 'loaded'
    else:
        raise ValueError('unknown type of worker node: %s' % node_type)

    for link in link_pool:
        print('We just %s the link: %s' % (verb, link.url))
```

(continues on next page)

(continued from previous page)

```

raise WorkerBreak

# register the hook function
register(dummy_hook)

```

## 4.2 Custom Proxy

See also:

- *How to implement a custom proxy middleware?*
- See `darc.proxy.register()` for technical information.

Sometimes, we need proxies to connect to certain targets, such as the Tor network and I2P proxy. *darc* decides if it need to use a proxy for connection based on the *proxy* value of the target link.

By default, *darc* uses *no proxy* for *requests* sessions and *selenium* drivers. However, you may use your own proxies by registering and/or customising the corresponding factory functions.

A typical factory function pair (e.g., for Socks5 proxy) can be defined as following:

```

import requests
import requests_futures.sessions
import selenium.webdriver
import selenium.webdriver.common.proxy
from darc.const import DARC_CPU
from darc.proxy import register
from darc.requests import default_user_agent
from darc.selenium import BINARY_LOCATION

def socks5_session(futures=False):
    """Socks5 proxy session.

    Args:
        futures: If returns a :class:`requests_futures.FuturesSession`.

    Returns:
        Union[requests.Session, requests_futures.FuturesSession]:
        The session object with Socks5 proxy settings.

    """
    if futures:
        session = requests_futures.sessions.FuturesSession(max_workers=DARC_CPU)
    else:
        session = requests.Session()

    session.headers['User-Agent'] = default_user_agent(proxy='Socks5')
    session.proxies.update(dict(
        http='socks5h://localhost:9293',
        https='socks5h://localhost:9293',
    ))
    return session

```

(continues on next page)

(continued from previous page)

```

def socks5_driver():
    """Socks5 proxy driver.

    Returns:
        selenium.webdriver.Chrome: The web driver object with Socks5 proxy settings.

    """
    options = selenium.webdriver.ChromeOptions()
    options.binary_location = BINARY_LOCATION
    options.add_argument('--proxy-server=socks5://localhost:9293')
    options.add_argument('--host-resolver-rules="MAP * ~NOTFOUND , EXCLUDE localhost"
    ↪')

    proxy = selenium.webdriver.Proxy()
    proxy.proxyType = selenium.webdriver.common.proxy.ProxyType.MANUAL
    proxy.http_proxy = 'socks5://localhost:9293'
    proxy.ssl_proxy = 'socks5://localhost:9293'

    capabilities = selenium.webdriver.DesiredCapabilities.CHROME.copy()
    proxy.add_to_capabilities(capabilities)

    driver = selenium.webdriver.Chrome(options=options,
                                       desired_capabilities=capabilities)

    return driver

# register proxy
register('socks5', socks5_session, socks5_driver)

```

## 4.3 Sites Customisation

See also:

- *How to implement a sites customisation?*
- See `darc.sites.register()` for technical information.

Since websites may require authentication and/or anti-robot checks, we need to insert certain cookies, animate some user interactions to bypass such requirements. `darc` decides which customisation to use based on the hostname, i.e. `host` value of the target link.

By default, `darc` uses `darc.sites.default` as the *no op* for both `requests` sessions and `selenium` drivers. However, you may use your own sites customisation by registering and/or customising the corresponding classes, which inherited from `BaseSite`.

A typical sites customisation class (for better demonstration) can be defined as following:

```

import time

from darc.const import SE_WAIT
from darc.sites import BaseSite, register

class MySite(BaseSite):
    """This is a site customisation class for demonstration purpose.

```

(continues on next page)

(continued from previous page)

```

    You may implement a module as well should you prefer."""

    #: List[str]: Hostnames the sites customisation is designed for.
    hostname = ['mysite.com', 'www.mysite.com']

    @staticmethod
    def crawler(session, link):
        """Crawler hook for my site.

        Args:
            session (requests.Session): Session object with proxy settings.
            link (darc.link.Link): Link object to be crawled.

        Returns:
            requests.Response: The final response object with crawled data.

        """
        # inject cookies
        session.cookies.set('SessionID', 'fake-session-id-value')

        response = session.get(link.url, allow_redirects=True)
        return response

    @staticmethod
    def loader(driver, link):
        """Loader hook for my site.

        Args:
            driver (selenium.webdriver.Chrome): Web driver object with proxy settings.
            link (darc.link.Link): Link object to be loaded.

        Returns:
            selenium.webdriver.Chrome: The web driver object with loaded data.

        """
        # land on login page
        driver.get('https://%s/login' % link.host)

        # animate login attempt
        form = driver.find_element_by_id('login-form')
        form.find_element_by_id('username').send_keys('admin')
        form.find_element_by_id('password').send_keys('p@ssd')
        form.click()

        driver.get(link.url)

        # wait for page to finish loading
        if SE_WAIT is not None:
            time.sleep(SE_WAIT)

        return driver

# register sites
register(MySite)

```

---

**Important:** Please note that you may raise `darc.error.LinkNoReturn` in the crawler and/or loader methods to indicate that such link should be ignored and removed from the task queues, e.g. `darc.sites.data`.

---

## DOCKER INTEGRATION

The *darc* project is integrated with Docker and Compose. Though published to [Docker Hub](#), you can still build by yourself.

---

**Important:** The debug image contains miscellaneous documents, i.e. whole repository in it; and pre-installed some useful tools for debugging, such as IPython, etc.

---

The Docker image is based on [Ubuntu Bionic](#) (18.04 LTS), setting up all Python dependencies for the *darc* project, installing [Google Chrome](#) (version 79.0.3945.36) and corresponding [ChromeDriver](#), as well as installing and configuring [Tor](#), [I2P](#), [ZeroNet](#), [FreeNet](#), [NoIP](#) proxies.

---

**Note:** [NoIP](#) is currently not fully integrated in the *darc* due to misunderstanding in the configuration process. Contributions are welcome.

---

When building the image, there is an *optional* argument for setting up a *non-root* user, c.f. environment variable `DARC_USER` and module constant `DARC_USER`. By default, the username is `darc`.

```

---

**Note:** Should you wish to run *darc* in reboot mode, i.e. set *DARC\_REBOOT* and/or *REBOOT* as *True*, you may wish to change the entrypoint to

```
bash /app/run.sh
```

where *run.sh* is a shell script wraps around *darc* especially for reboot mode.

```
#!/usr/bin/env bash

set -e

# time lapse
WAIT=${DARC_WAIT:=10}

# signal handlers
trap '[ -f ${PATH_DATA}/darc.pid ] && kill -2 $(cat ${PATH_DATA}/darc.pid)' SIGINT_
↪SIGTERM SIGKILL

# initialise
echo "+ Starting application..."
python3 -m darc $@
sleep ${WAIT}

# mainloop
while true; do
  echo "+ Restarting application..."
  python3 -m darc
  sleep ${WAIT}
done
```

In such scenario, you can customise your *run.sh* to, for instance, archive then upload current data crawled by *darc* to somewhere else and save up some disk space.

---

## WEB BACKEND DEMO

This is a demo of API for communication between the *darc* crawlers (*darc.submit*) and web UI.

**See also:**

Please refer to *data schema* for more information about the submission data.

Assuming the web UI is developed using the *Flask* microframework.

```
# -*- coding: utf-8 -*-

import sys

import flask # pylint: disable=import-error

# Flask application
app = flask.Flask(__file__)

@app.route('/api/new_host', methods=['POST'])
def new_host():
    """When a new host is discovered, the :mod:`darc` crawler will submit the
    host information. Such includes ``robots.txt`` (if exists) and
    ``sitemap.xml`` (if any).

    Data format::

## DATA MODELS DEMO

This is a demo of data models for database storage of the submitted data from the *darc* crawlers.

Assuming the database is using *peewee* as ORM and *MySQL* as backend.

```
# -*- coding: utf-8 -*-

import datetime
import os

import peewee
import playhouse.shortcuts

# database client
DB = playhouse.db_url.connect(os.getenv('DB_URL', 'mysql://127.0.0.1'))

def table_function(model_class: peewee.Model) -> str:
    """Generate table name dynamically.

    The function strips ``Model`` from the class name and
    calls :func:`peewee.make_snake_case` to generate a
    proper table name.

    Args:
        model_class: Data model class.

    Returns:
        Generated table name.

    """
    name: str = model_class.__name__
    if name.endswith('Model'):
        name = name[:-5] # strip ``Model`` suffix
    return peewee.make_snake_case(name)

class BaseMeta:
    """Basic metadata for data models."""

    #: Reference database storage (c.f. :class:`~darc.const.DB`).
    database = DB

    #: Generate table name dynamically (c.f. :func:`~darc.model.table_function`).
    table_function = table_function
```

(continues on next page)

(continued from previous page)

```

class BaseModel(peewee.Model):
    """Base model with standard patterns.

    Notes:
        The model will implicitly have a :class:`~peewee.AutoField`
        attribute named as :attr:`id`.

    """

    #: Basic metadata for data models.
    Meta = BaseMeta

    def to_dict(self, keep_id: bool = False):
        """Convert record to :obj:`dict`.

        Args:
            keep_id: If keep the ID auto field.

        Returns:
            The data converted through :func:`playhouse.shortcuts.model_to_dict`.

```

## AUXILIARY SCRIPTS

Since the *darc* project can be deployed through *Docker Integration*, we provided some auxiliary scripts to help with the deployment.

### 9.1 Health Check

#### File location

- Entry point: `extra/healthcheck.py`
- System V service: `extra/healthcheck.service`

```
usage: healthcheck [-h] [-f FILE] [-i INTERVAL] ...

health check running container

positional arguments:
  services              name of services

optional arguments:
  -h, --help            show this help message and exit
  -f FILE, --file FILE  path to compose file
  -i INTERVAL, --interval INTERVAL
                        interval (in seconds) of health check
```

This script will watch the running status of containers managed by Docker Compose. If the containers are stopped or of *unhealthy* status, it will bring the containers back alive.

Also, as the internal program may halt unexpectedly whilst the container remains *healthy*, the script will watch if the program is still active through its output messages. If inactive, the script will restart the containers.

### 9.2 Upload API Submission Files

#### File location

- Entry point: `extra/upload.py`
- Helper script: `extra/upload.sh`
- Cron sample: `extra/upload.cron`

```
usage: upload [-h] [-p PATH] -H HOST [-U USER]

upload API submission files

optional arguments:
  -h, --help            show this help message and exit
  -p PATH, --path PATH  path to data storage
  -H HOST, --host HOST  upstream hostname
  -U USER, --user USER  upstream user credential
```

This script will automatically upload API submission files, c.f. `darc.submit`, using `curl(1)`. The `--user` option is supplied for the same option of `curl(1)`.

---

**Important:** As the `darc.submit.save_submit()` is categorising saved API submission files by its actual date, the script is also uploading such files by the saved dates. Therefore, as the `cron(8)` sample suggests, the script should better be run everyday *slightly after 12:00 AM* (0:00 in 24-hour format).

---

## 9.3 Remove Repeated Lines

**File location** `extra/uniq.py`

This script works the same as `uniq(1)`, except it filters one input line at a time without putting pressure onto memory utilisation.

## RATIONALE

There are two types of *workers*:

- *crawler* – runs the `darc.crawl.crawler()` to provide a fresh view of a link and test its connectability
- *loader* – run the `darc.crawl.loader()` to provide an in-depth view of a link and provide more visual information

The general process can be described as following for *workers* of *crawler* type:

1. `process_crawler()`: obtain URLs from the `requests` link database (c.f. `load_requests()`), and feed such URLs to `crawler()`.

---

**Note:** If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

---

2. `crawler()`: parse the URL using `parse_link()`, and check if need to crawl the URL (c.f. `PROXY_WHITE_LIST`, `PROXY_BLACK_LIST`, `LINK_WHITE_LIST` and `LINK_BLACK_LIST`); if true, then crawl the URL with `requests`.

If the URL is from a brand new host, *darc* will first try to fetch and save `robots.txt` and sitemaps of the host (c.f. `save_robots()` and `save_sitemap()`), and extract then save the links from sitemaps (c.f. `read_sitemap()`) into link database for future crawling (c.f. `save_requests()`). Also, if the submission API is provided, `submit_new_host()` will be called and submit the documents just fetched.

If `robots.txt` presented, and `FORCE` is `False`, *darc* will check if allowed to crawl the URL.

---

**Note:** The root path (e.g. / in `https://www.example.com/`) will always be crawled ignoring `robots.txt`.

---

At this point, *darc* will call the customised hook function from `darc.sites` to crawl and get the final response object. *darc* will save the session cookies and header information, using `save_headers()`.

---

**Note:** If `requests.exceptions.InvalidSchema` is raised, the link will be saved by `save_invalid()`. Further processing is dropped.

---

If the content type of response document is not ignored (c.f. `MIME_WHITE_LIST` and `MIME_BLACK_LIST`), `submit_requests()` will be called and submit the document just fetched.

If the response document is HTML (`text/html` and `application/xhtml+xml`), `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the database (c.f. `save_requests()`).

And if the response status code is between 400 and 600, the URL will be saved back to the link database (c.f. `save_requests()`). If **NOT**, the URL will be saved into selenium link database to proceed next steps (c.f. `save_selenium()`).

The general process can be described as following for *workers* of `loader` type:

1. `process_loader()`: in the meanwhile, *darc* will obtain URLs from the selenium link database (c.f. `load_selenium()`), and feed such URLs to `loader()`.

---

**Note:** If `FLAG_MP` is `True`, the function will be called with *multiprocessing* support; if `FLAG_TH` if `True`, the function will be called with *multithreading* support; if none, the function will be called in single-threading.

---

2. `loader()`: parse the URL using `parse_link()` and start loading the URL using selenium with Google Chrome.

At this point, *darc* will call the customised hook function from `darc.sites` to load and return the original `WebDriver` object.

If successful, the rendered source HTML document will be saved, and a full-page screenshot will be taken and saved.

If the submission API is provided, `submit_selenium()` will be called and submit the document just loaded.

Later, `extract_links()` will be called then to extract all possible links from the HTML document and save such links into the `requests` database (c.f. `save_requests()`).

---

**Important:** For more information about the hook functions, please refer to the *customisation* documentations.

---

## INSTALLATION

---

**Note:** `darc` supports Python all versions above and includes **3.6**. Currently, it only supports and is tested on Linux (*Ubuntu 18.04*) and macOS (*Catalina*).

When installing in Python versions below **3.8**, `darc` will use `walrus` to compile itself for backport compatibility.

---

```
pip install darc
```

Please make sure you have Google Chrome and corresponding version of Chrome Driver installed on your system.

---

**Important:** Starting from version **0.3.0**, we introduced `Redis` for the task queue database backend.

Since version **0.6.0**, we introduced relationship database storage (e.g. `MySQL`, `SQLite`, `PostgreSQL`, etc.) for the task queue database backend, besides the `Redis` database, since it can be too much memory-costly when the task queue becomes vary large.

Please make sure you have one of the backend database installed, configured, and running when using the `darc` project.

---

However, the `darc` project is shipped with Docker and Compose support. Please see *Docker Integration* for more information.

Or, you may refer to and/or install from the `Docker Hub` repository:

```
docker pull jsnbzh/darc[:TAGNAME]
```

## USAGE

---

**Important:** Though simple CLI, the *darc* project is more configurable by environment variables. For more information, please refer to the *environment variable configuration* documentations.

---

The *darc* project provides a simple CLI:

```
usage: darc [-h] [-v] -t {crawler,loader} [-f FILE] ...

the darkweb crawling swiss army knife

positional arguments:
  link                  links to crawl

optional arguments:
  -h, --help            show this help message and exit
  -v, --version          show program's version number and exit
  -t {crawler,loader}, --type {crawler,loader}
                        type of worker process
  -f FILE, --file FILE  read links from file
```

It can also be called through module endpoint:

```
python -m python-darc ...
```

---

**Note:** The link files can contain **comment** lines, which should start with #. Empty lines and comment lines will be ignored when loading.

---
